a: Known compounds and physical data agreed with reported values.
b: Solvent: CH\textsubscript{2}Cl\textsubscript{2}, c = 1.0 at room temperature.
The biological significance of β-1,4-linked oligomers of glucosamine (e.g., chitin) is well recognized.\textsuperscript{155} Also, the hydroxyl group at the C-4 position of GlcN is known to be relatively unreactive.\textsuperscript{127b} Therefore, the construction of this type of oligosaccharide is a challenging task and a test of the utility of a given method of glycosylation.\textsuperscript{156} To this end, partially protected D-GlcN derivatives were prepared as indicated in scheme 3.5. The triol products of Zemplén de-O-acetylation of 32 and 36 were directly treated with α,α-dimethoxytoluene and p-TsOH in DMF Solvent (or acetonitrile), to give the benzylidene derivatives 38 and 39 in 85% and 90% yields, respectively. Compound 38 was benzylated using benzyl bromide and sodium hydride in N,N-dimethyl-formamide, giving compound 40 in 85% yield. The 4,6-benzylidene acetal in 40 was opened by treatment with sodium cyanoborohydride and HCl-diethyl ether in tetrahydrofuran,\textsuperscript{157} to give the 4-OH compound 41 in 83% yield. A possible mechanism for the reductive ring opening of a benzylidene acetal containing one primary and two secondary carbon atoms with a hydride and an acid was studied by Garegg et al.\textsuperscript{158} for the sodium cyanoborohydride-hydrogen chloride reductions. The steric requirement of the electrophile H\textsuperscript{+} is much smaller than that of Lewis acid and thus favors thermodynamic protonation of O-4 rather than O-6, giving mainly the 6-O-benzyl regioisomer. The regiochemistry of this ring opening reaction was confirmed by the \textsuperscript{13}C-NMR spectrum, the C-4 signal showed a significant upfield shift from the δ 83.0 ppm in 40 to 74.8 ppm in 41.\textsuperscript{159}

Scheme 3.5 Synthesis of partially protected 2-deoxy 2-phthalimido-1-thio-\(\beta\)-D-glucopyranosides

Scheme 3.6 Pivaloylation of GlcN triol 42

As an alternative, partially protected GlcN thioglycosyl acceptors could be prepared directly by pivaloylation of GlcN triol 42 (scheme 3.6). Treatment of triol 42
with pivaloyl chloride (2.4 equiv.) in pyridine afforded, after a long reaction time (48 hours), 45% of monopivaloylated compound 43 and 35% dipivaloylated compound 44.

3.3 Preparation of “Active and Latent” Galactopyranosyl Donors and Acceptors

D-Galactose is a constituent of complex glycosphingolipids and glycoproteins, where it plays an important role.\(^{160}\) It is found as a terminal or subterminal building block in a variety of different linkages. In glycosphingolipids, galactose is part of the lactosyl ceramide core-structure. Terminal and subterminal β-(1→4) linkages to 2-acetamido-2-deoxy-D-glucopyranose (N-acetylgalactosamine, GlcNAc) leads to the N-acetyllactosamine moiety, which is alone a very important building block in the synthesis of Le\(^a\) and sialyl Le\(^a\). This topic will be discussed in detail in chapter 6 of this thesis. The GlcNAc β-(1→6) Gal is a core structure of the capsular polysaccharide (CPS) of *Haemophilus Pleuropneumonia* Serotype 1 which is recognized as an important bacteria virulence factors.\(^{161}\) β-(1→6) linked D-galactopyranoside oligomers were found to be the optimal binding determinant of some monoclonal IgA's.\(^{162}\)

Our “active-latent” glycosylation strategy for the synthesis of important oligosaccharides depends primarily on suitably protected active and latent thioglycosyl donors and acceptors. To this end, β-D-galactopyranosyl derivatives 48-77 with suitable protecting groups were prepared (Scheme 3.7).

Standard Zemplén deacetylation of peracetylated thioglycosides 7-9 gave intermediates 45-47 which, without further purification, were benzoylated using benzoyl chloride in pyridine to give per-O-benzoylated thioglycosides 48-50.

---

To demonstrate the effectiveness of active-latent glycosylation strategy, tetraol 47 was chosen as a key intermediate for further transformations, the facile experimental operation allowed the preparation of 47 in large scale without difficulty. It should be noted that the \(^1\)H NMR spectrum of 47 shows a multiplet pattern at 5.02 ppm for the H-1 signal instead of the expected doublet. A related phenomenon has been observed\(^{163}\) in the disaccharide methyl N,N'-diacetyl-\(\beta\)-chitobioside as arising from the long range coupling of H-2 and H-3. Benzylation of 47 with benzyl bromide in N,N-dimethylformamide gave “armed-latent” glycosyl donor 52 in 81% yield.

The usual strategies for the preparation of primary 6-OH free galactosyl acceptor involved (1) temporary protection at 6-OH as trityl, tert-butyldimethylsilyl\(^{164}\) (TBDMS), tert-butyldiphenylsilyl (TBDPS) or tosyl ether, (2) protection of the remaining hydroxyl groups and finally; (3) selective deprotection of O-6.

The most promising preparation of 6-OH free glycosyl acceptor appeared to be tert-butyldimethylsilyl (TBDMS) and tert-butyldiphenylsilyl (TBDPS) ethers which we chose accordingly. Both silyl chlorides (TBDMS-Cl and TBDPS-Cl) were capable of regioselective silylation of 1-thio-D-galactopyranoside using pyridine as solvent to give the 6-O-silyl derivatives 53 and 54 in 87% and 89% yield respectively. The remaining hydroxyl groups in 53 and 54 were protected as benzoyl, or pivaloyl esters to give bifunctional galactosides 57-60. It should be mentioned that the protection of the remaining triols in 54 with the bulky pivaloyl groups encountered some difficulty. The pivaloylation reaction was very sluggish and was not finished after 3 days at room temperature, under a forcing condition, heating reaction mixture to 70 °C for 8 hours, gave the tripivaloylated product 60 in 53% and tetrapivaloylated derivative 51 in 36% yield respectively.

For the selective deprotection of the 6-hydroxyl group, two different reagents and procedures were examined. First, the widely used tetra-n-butylammonium fluoride\(^{165}\)

when reacted with galactoside derivatives 57, 59 and 60 gave a complex mixture attributable to extensive O-acyl migration.\textsuperscript{166,167} The most effective method\textsuperscript{168} for selective de-O-silylation of galactopyranosides 57, 59 and 60 was based on the use of 3% hydrogen chloride in methanol/ether (1:1, v/v), freshly prepared from acetyl chloride and methanol. Under these conditions, the cleavage of the silyl groups occurred smoothly at room temperature and the 6-O-deproteced galactopyranosides 63-65 were obtained almost quantitatively.

Attempts to prepare the “latent-armed” acceptor 66 using the method suggested by Ohrui \textit{et al.}\textsuperscript{169} were not successful in our hands. Benzylolation of 6-O-silyl galactoside 54 led to concomitant cleavage of the 6-O-TBDMS group under basic conditions and gave perbenzyalted galactopyranoside 52 as the major product. Therefore, the most stable para-nitrophenyl 6-O-trityl-2,3,4-tri-O-benzyl-1-thio-β-D-galactopyranoside 61 was prepared accordingly. Thus, galactopyranoside 47 was treated with trityl chloride in pyridine\textsuperscript{170} giving 6-O-tritylated galactopyranoside 51 which was directly benzyalted to afford 61 in 86% yield (two steps). Subsequent detritylation of 61 using p-toluensusfonic acid as a catalyst finished the preparation of “latent-armed” acceptor 66 in 95% yield.

One of the major breakthroughs in new strategies for oligosaccharide synthesis has been the use of “lightly protected” acceptors, i.e. acceptors where there are several OH groups unprotected, especially near the position at which one wishes the glycosidic bond to be formed. So far, total syntheses of gangliosides GM_{1b}\textsuperscript{171,172} and GD_{1α}\textsuperscript{173} have been reported using this strategy. The benefit of using lightly protected acceptors, which results mostly from the lack of additional steric impediments, is not unique to sialoside formation,

\footnotesize
but also to other complex oligosaccharide syntheses.\textsuperscript{174} Our ongoing research project was to synthesize biologically important oligosaccharides, including the sialosides. To this end, "latent" lightly protected galactosides 70, 71 were prepared.

A one-pot, two step procedure\textsuperscript{175} for the preparation of para-nitrophenyl 3,4-O-isopropylidene-1-thio-β-D-galactopyranoside 67 in high yield was used. Initially para-nitrophenyl-1-thio-β-D-galactopyranoside 47 was transacetylated with 2,2-dimethoxypropane, catalyzed by p-toluenesulfonic acid, and then, through the mild selective hydrolysis of the cyclic acetal group, 67 was prepared.\textsuperscript{176} Benzylation of 67 followed deacetylation under acidic conditions gave "latent" 3,4-diol acceptor 70 in 90% yield (two steps). However, selective benzylation at the 6-OH in 67 gave di- and mono-benzyolated product mixture. Under optimized reaction condition, i.e. using pyridine-dichloromethane (1:3 v/v) as solvent and low reaction temperatures (-70 °C), the desired 6-O benzoyl galactoside 69 was obtained in 63% yield together with dibenzoylated product 68 (18%) and recovered starting material 67 (10%). The structure of 68 and 69 was confirmed from their $^1$H-NMR spectra. The H-2 signal ($\delta = 3.76$ ppm) of 69 was more shielded (upfield) compared to that of the H-2 signal ($\delta = 5.38$ ppm) of 68. Finally, deacetylations of 68 and 69 were completed using p-toluenesulfonic acid as catalyst to give di- and mono-benzyolated glycosyl acceptors 70 and 71 in quantitatively yield.

It was recently reported\textsuperscript{177} that a tosyl protected sugar could be directly coupled with 1-thioglycosyl donor to give biologically interesting sulfur linked oligosaccharides. To this end, a 6-tosyl protected galactoside 62 was prepared efficiently in 79% yield using one pot two-step procedure (tosylation and acetylation).

Scheme 3.7 Synthetic Transformations of Thiogalactopyranosides
Scheme 3.8 Transformation of “Latent” Thioglycosyl Donors Into “Active” Thioglycosyl Donors

A very important aspect of our “active-latent” glycosylation strategy was to transform the “latent” glycosyl donors into an “active” form. An efficient method for the conversion of an electron withdrawing group (EWG) in aglycon moiety into an electron donating group (EDG) resulting in “active” glycosyl donors was desirable. Catalytic transfer hydrogenation with ammonium formate and 10% Pd-C,\textsuperscript{178} was used successfully.

\textsuperscript{178} Ram, S.; Ehrenkauf, E. Synthesis 1988, 91.
in our lab for the reduction of O-para-nitrophenyl derivatives, was unsuccessful when applied to the S-para-nitrophenyl glycosides. However, the nitro groups in thioglycosides were effectively reduced with tin(II) chloride in refluxing ethanol to give the corresponding aminophenyl thioglycosides (Scheme 3.8). The resulting aminophenyl thioglycosides could be directly acetylated with acetic anhydride in pyridine to provide the desired para-N-acetamidophenyl thioglycosides. The “active” donors 75-79 were prepared in 85-90% overall yield. These para-N-acetamidophenyl thioglycosides were successfully applied as “active” donors in our “active-latent” glycosylation strategy and this topic will be elaborated in the following section. It is worthy noting that the intermediate para-aminophenyl thioglycosides obtained were fairly stable and, whenever necessary, could be purified by silica gel column chromatography without oxidation.

3.4 Synthesis of β(1→6) and β(1→3) Linked Oligosaccharides Using
“Active-Latent” Glycosylation Strategy

The feasibility of the “active-latent” glycosylation strategy using the strong thiophilic N-iodosuccinimide/triflic acid (NIS/TfOH) promoter was first demonstrated by the glycosylation of terminal181 glycosyl acceptor 1,2:3,4-di-O-isopropylidene-α-D-galactopyranose 80 with N-phthaloyl (Pth) protected 1-thio-β-D-glucosamine (GluN) derivatives 32, 33, 36 and 78 as well as with thiogalactopyranosides 50 and 76 (scheme 3.9).

---

181 A terminal acceptor contains, in contrast with a non-terminal one, an anomeric group which cannot be activated in situ by a promoter.
Scheme 3.9 Glycosylation of Terminal Acceptor 80

We set out to test different reactivities of thioglycosyl donors. Glycosyl acceptor 80 was chosen as a model acceptor because of its intrinsic inertness under the glycosylation condition applied and thus excluded the possible cross coupling and hence simplifies the glycosylation reaction. Thioglycosides were activated with NIS/TFOH in the presence of the glycosyl acceptor and 4 Å molecular sieves (to ensure strict anhydrous conditions) in methylene chloride (CH₂Cl₂) at -30 °C leading to disaccharides in good to excellent yields, the reaction being completed usually in less than 30 minutes. Table 3.3 includes some of the examples of O-glycosides synthesized according to the above description and helps to illustrate the efficiency, applicability, and scope of this glycosylation strategy.
Table 3.3 Glycosylation of 1,2:3,4-di-O-Isopropylidene α-D-Galactose 80 with Donor 32, 33, 36, 50, 76 and 78

* Reaction conditions: solvent, CH₂Cl₂; donor: acceptor = 1.2:1; reactions were executed at -30 °C using NIS/TfoH as promoter and at r.t. using DMTST as promoter.

b Isolated yield.

Quite impressively, the coupling reaction between ethylthio glycoside 32 and acceptor 80 (table 3.3, entry 1) was finished in 10 min and provided disaccharide 81 in high yield (92%). As comparison, using DMTST as a promoter, the coupling reaction between the same donor 32 and acceptor 80 (entry 2) required longer reaction time (5h) to finish and afforded disaccharide 81 in 75% yield.

It is of interest to note that the glycosylation reaction between active phenyl thioglycosyl donor 33 and acceptor 80 was finished in 25 min (entry 3, 77%) while treatment of the “latent” (unreactive) para-nitrophenyl thioglycosyl donor 36 with the same acceptor 80 under the above conditions (entry 4) gave no detectable formation of the corresponding disaccharide 81. However, transformation of the “latent” donor 36 into the active form 78 and glycosylation of 80 as above (entry 5) provided disaccharide 81 in 80% yield.
yield. Similarly, treatment of the "latent" donor 78 with 80 (entry 6) gave no glycosylation product, while the glycosylation reaction between "active" donor 76 with 80 gave disaccharide 82 in an excellent yield (entry 7, 94%). The β configurations of the newly introduced anomeric centers of the disaccharides 81 and 82 were assigned from the $^1$H NMR spectra which showed doublets for H-1 at δ 5.42 ($J_{1',2'} = 8.5$ Hz) and at 4.99 ppm ($J_{1',2'} = 8.0$ Hz), respectively.

In order to further confirm the above finding, a qualitative experiment was performed (scheme 3.10). A mixture of "latent" donor 50 (0.5 eq) and "active" donor 78 (0.5 eq) were allowed to compete for the glycosyl acceptor 80 (1.0 eq) under the condition described above. The active donor 76 was consumed in 20 min while the "latent" donor 50 was found unreacted after 3 hrs.

Scheme 3.10  Competitive Glycosylation Reaction Between a "Latent" Donor 50 and an "Active" Donor 76
Encouraged by the observed different reactivities between the various ethylphenyl and para-nitrophenyl thioglycosides in the glycosylation reactions, we reasoned that selective activation of ethyl or phenyl thioglycosyl donors (active donors) in the presence of para-nitrophenyl thioglycosyl acceptors (latent acceptors) might be possible. To this end, the glycosylation reactions between “active” donors 32, 41, 49, 53 and “latent” acceptor 64 using NIS/TfOH as promoter were examined (scheme 3.11).

Actually, all the in situ iodonium-ions promoted glycosylation of the “latent” acceptor 64 with “active” donors were essentially all completed in less than 30 min. No self coupling of 64 was observed under the glycosylation conditions. Some of the results are given in table 3.4. It should be noted that glycosyl donor 41 itself contains a free hydroxy group at C-4, however, the 4-OH group of glycoside 41 is known to be relatively unreactive, no β(1→4) selfcoupling product was observed during the glycosylation reaction. The disaccharide 83 and 84 contained the core structure GlcNAc β-(1→6) Gal of the capsular polysaccharide (CPS) of a Haemophilus Pleuropneumonia Serotype 1. Therefore disaccharide 83 and 84 could serve as building blocks for the synthesis of this biologically important macromolecule. Disaccharide 86 is very useful in blockwise synthesis of more complex oligosaccharide. It can serve as a potential donor as well as a potential acceptor. The conversion of the nitro group into the N-acetamido group allows disaccharide 86 to become an “active” donor. In addition, the eventual removal of 6-O silyl protecting group from the disaccharide 86 converts this disaccharide into a glycosyl acceptor.
Scheme 3.11 Glycosylation of "latent-disarmed" acceptor 64 with "active-disarmed" donors 32, 41, 49 and 53.

* Reaction conditions: solvent, CH₂Cl₂; all the reactions were carried out at -30 °C.

b. Molar ratios of donor/acceptor/NIS/TfOH.

c. Isolated yield.

Selective activation of a “disarmed-active” donor in the presence of an “armed-latent” glycosyl acceptor was examined next (scheme 3.12). The first attempt to glycosylate “armed-latent” 66 acceptor with “disarmed-latent” donor 32 using NIS/TfOH as a promoter led to an intractable mixture of products. A possible explanation for this result is that the electron-donating effect by the benzyl group (armed) at C-2 minimized the effect of the electron withdrawing 4-nitrophénylthio group at the anomeric center. As a result, the “latent” acceptor was not really latent in the presence of the powerful activation system (NIS/TfOH). Formation of 1,6-anhydro derivative\(^{\text{182}}\) as well as self coupling\(^{\text{183}}\) was possible. However, we found that the “armed-latent” acceptor 66 was glycosylated smoothly in methylene chloride at room temperature with “disarmed-active” donor 32 using the weaker thiophilic methyl triflate (MeOTf) promoter, to give

\(^{\text{183}}\) Self-coupling means that under certain glycosylation conditions, a non-terminal acceptor could be activated by the activating agent and coupled itself to form self-coupled products, dimer, trimer, tetramer and so on.
disaccharide 89 in 77% yield. The configuration of the newly introduced anomic center was expected to be β due to the presence of the phthalimido group in the glycosyl donor, which favor the formation of β-1,2-trans stereochemistry. Indeed, the $^1$H-NMR spectrum of 89 showed the anomic H-1' signal as a doublet at δ 5.43 ppm ($J_{1',2'} = 7.9$ Hz).

Disaccharide 89 could be directly used as a glycosyl donor using a more powerful promoter (such as NIS/TfOH) without manipulating the anomic center or by a simple two step reaction (reduction and acetylation) to transform the 4-nitrophenylthio group into the more reactive 4-acetylaminomethylphenylthio group. Furthermore, it is also well-known that the presence of a non-participating 2-ether function in the donor favors the formation of 1,2-cis linked glycosides. On the basis of this knowledge, together with the availability of effective thiophilic promoters, it is to be expected that the “armed” disaccharide 89 could be a valuable synthon for the synthesis of the capsular polysaccharide (CPS) of *Haemophilus Pleuropneumonia* Serotype 1 which contains GlcNACβ(1→6)Gal α phosphate repeating unit.

![Scheme 3.12](image)

**Scheme 3.12** Glycosylation of “latent-armed” acceptor with “active-disarmed” donor

The selective activation of ethyl thioglycoside 48 in the presence of phenyl thioglycoside acceptor 63 was examined next. This coupling reaction (Scheme 3.13) was
complete within 5 min and gave disaccharide 90 in 89% yield. This observation, i.e. the preferential activation of ethyl thioglycosides over that of phenyl thioglycosides, was also corroborated by recent results reported by Zhang et al.\textsuperscript{184} upon methyl triflate promoted glycosylation reactions.

![Chemical Structures](image)

**Scheme 3.13 Selective Activation of Ethyl Thioglycosyl Donor over Phenyl Thioglycosyl Acceptor**

The versatility of the "active-latent" glycosylation strategy in oligosaccharide synthesis was further illustrated by the synthesis of the trisaccharide β-D-Galp-(1-6)-β-D-Galp-(1-6)-β-D-Galp 92. "Active" glycosyl donor 76, prepared from the "latent" donor 73 (see section 3.3) was selectively activated in the presence of "latent" acceptor 64 using NIS/TfOH as promoter to give disaccharide 85 in 83 % yield. Again, the reactivity of the "latent" disaccharide 85 could be "turned on" by means of reduction (SnCl\textsubscript{2}, EtOH, reflux) and acetylation (Ac\textsubscript{2}O, pyridine) to give "active" form 91 (scheme 3.14).

Successful glycosylation of "latent" glycosyl acceptor 64 with "active" disaccharide donor 91 was achieved in methylene chloride using NIS/TfOH as the activator to provide trisaccharide 92 in 88% yield. (Scheme 3.15). It is worthwhile mentioning that "latent" trisaccharide 92 could again be easily transformed to an "active"

form by the method described above and can serve as a new glycosyl donor in further chain elongation.

Scheme 3.14 Synthesis of "Active" Galβ1→6Galβ Disaccharide

Scheme 3.15 Synthesis of the Trisaccharide β-D-Galp-(1-6)-β-D-Galp-(1-6)-β-D-Galp
The next step was to examine the glycosylation reactions of “disarmed-latent” acceptor 64 with “armed-latent” 52 and “armed-active” 77 glycosyl donors (scheme 3.16).

Scheme 3.16  Glycosylation of “Disarmed-Latent” Acceptor with “Armed-Active” and “Armed-Latent” Donors
There are several important points worth of addressing. First, as expected, the glycosylation reaction was faster for the more reactive “armed-active” donor 77 (25 min) than for the “armed-latent” donor 52 (65 min) under the same glycosylation conditions. This provided an additional example for the higher reactivity of a 4-acetamidophenyl thioglycoside (active) over that of a 4-nitrophenylthio counterpart. Secondly, the α-stereoselectivities of both glycosylation reactions were due to the non-participating nature of the C-2 ether group, though there was a slightly better α-stereoselectivity using glycosyl donor 52 (4:1, α:β) over that of glycosyl donor 77 (3:1, α:β). Thirdly, not only “armed-active” glycosyl donor 77 but also “armed-latent” glycosyl donor 52 could be chemoselectively activated in the presence of “disarmed-latent” acceptor 64 using NIS/TfOH as thiophilic promoter. Disaccharides 87a and 87b were obtained as α/β mixture in 92% and 76% yield respectively and no self-condensation product was detected in either sequence. The α/β mixture could be successfully separated by silica gel column chromatography using 1% t-butanol in dichloromethane as eluent. The stereochemistry of the newly generated anomic center was confirmed from the 1H NMR spectra which showed a doublet at 8 4.79 ppm (J1,2 = 3.7 Hz) for the α anomer 87a and at 8 4.38 ppm (J1,2 = 7.7 Hz) for the β anomer 87b. Finally, the glycosylation reaction between the “armed-latent” glycosyl donor 52 and “disarmed-latent” acceptor 64 provided the first example for the coupling two so-called “latent” glycosides using powerful thiophilic promoter (NIS/TfOH). As a comparison, an earlier study from van Boom’s group revealed that “disarmed” ethyl thioglycosyl acceptor could be condensed chemoselectively in the presence of the weak thiophilic promoter sym-collidine perchlorate (IDCP) with “armed” ethyl thioglycosyl donor.185

To further demonstrate the generality of “latent-active” glycosyl strategy in oligosaccharide synthesis, the more difficult β(1→3) glycosylation was examined next (scheme 3.17).

\text{49} & \quad \text{+} \quad \text{49} \\
\end{align*}
\]

Scheme 3.17 Preparation of Synthons for Le³ and Le⁴

Glycosylation of “latent-disarmed” acceptor 39 with ethyl 1-thio-β-L-fucopyranoside 93 at -30 °C in dichloromethane with 4Å MS, promoted by NIS/TfOH, gave the thermodynamically stable α-(1→3) disaccharide 94 in 83 % yield. Under similar glycosylation conditions, glycosylation of “latent-disarmed” acceptor 39 with “active-armed” β-D-galactopyranoside 49 afforded β-(1→3) disaccharide 95 in 71% yield. The stereochemistry of the newly introduced anomeric centers of disaccharides 94 and 95 were

\[\text{185} \quad \text{Lönn, H. Carbohydr. Res. 1985, 139, 105}\]
determined by $^1$H NMR spectra which showed doublets for H-1' at δ 4.79 ppm ($J_{1',2'} = 1.2$ Hz) and at δ 4.93 ppm ($J_{1',2'} = 8.0$ Hz) respectively. It is also worth mentioning that disaccharides 94 and 95 were versatile synthons for Le$^a$ and Le$^b$ respectively.

Condensation of phenyl 1-thio-D-galactopyranoside 49 with the diol 96, readily obtained$^{187}$ from 4-nitrophenyl 3’,4’-O-isopropylidene-2,3,6,2’,6’-penta-O-benzoyl-1-thio-β-D-lactopyranoside by hydrolysis, gave $\beta$(1→3) linked trisaccharide 97 in 72% yield. The newly introduced β-anomeric center in 97 was assigned from the $^1$H NMR spectrum which showed a doublet for H-1” at δ 4.89 ppm ($J_{1',2'} = 8.0$ Hz). The $^1$H-NMR spectrum of 97 was less informative in confirming the regiochemistry of the newly introduced glycosidic linkage of 97. However, the regioselectivity could be confirmed from the $^{13}$C NMR spectrum which showed a deshielded signal for C-3’ at δ 81.1 ppm (Δδ = +8.0 ppm) of trisaccharide 97 compared to δ 73.1 ppm for C-3’ of the starting material 96.

Scheme 3.18  Selective Glycosylation of Diol 96

$^{187}$ The preparation of this compound will be discussed in chapter 4 of this thesis.

95
The versatility of the “active-latent” glycosylation strategy in oligosaccharide synthesis was further demonstrated by the synthesis of a Le\(\text{\textsuperscript{y}}\) analogue (scheme 3.19). The acceptor 98 was glycosylated with L-fucosyl donor 93 to give trisaccharide 99 in 68% yield after silica gel column chromatography. The relatively low glycosylation yield could be explained by the concomitant formation of the dehydro product 100. This phenomenon is not uncommon when a very active donor and a relatively hindered glycosyl acceptor are used in a glycosylation reaction. Again the α configuration of the newly introduced anomeric center for 99 was confirmed by \(^1\)H NMR spectrum which showed a doublet for H-1” at \(\delta 5.33\) ppm (\(J_{\text{1-2"}} = 3.8\) Hz).

![Scheme 3.19 Synthesis of Le\(\text{\textsuperscript{y}}\) Analogue](image)

The application of thioglycosides gained a new impetus by the finding of Kahne et al.\(^{188}\) Kahne and coworker realized that phenylsulfenyl glycosyl donors which are readily

accessible by oxidation (mCPBA) of phenyl thioglycosides can be effectively glycosylated using triflic anhydride as activator. It was revealed by the same group\textsuperscript{189} that the glycosylation of phenyl thioglycosides with phenylsulfonyl glycoside occurs selectively under the influence of triflic acid (TfOH) and in the presence of scavenger methyl propiolate (MP). The latter finding, together with the fact that the reactivity of phenylsulfonyl donors can be regulated by the introduction of EWG or EDG groups at the para position of the phenyl ring (reactivity order: OMe > H > NO\textsubscript{2}), enabled Kahne \textit{et al.}\textsuperscript{54} to assemble a precursor of the cyclamycin trisaccharide in a one-step synthesis.

To widen the scope of para-nitrophenyl thioglycosides in oligosaccharide synthesis, we also explored the possibility to activate the para-nitrophenyl thioglycoside by means of the oxidation method used by Kahne \textit{et al.}\textsuperscript{184} Our first attempt to condense perbenzoylated 4-nitrophenylsulfinyl glycoside 88, prepared in 65% yield by oxidation of 50\textsuperscript{190} with mCPBA, with para-nitrophenyl thioglycosyl acceptor 64 using Tf\textsubscript{2}O as promoter at -78 °C failed. No trace of coupling product 85 could be detected. However, using NIS/TfOH as a promoter, disaccharide 85 was obtained in 20% yield (see Scheme

\begin{center}
\includegraphics[width=\textwidth]{scheme.png}
\end{center}

\textbf{Scheme 3.20} Glycosylation of 4-Nitrophenylsulfonyl Glycoside 88 with Latent Acceptor 64

3.20). This preliminary result and our previous results revealed that to activate the “disarmed-latent” donor 50 using oxidation method was less effective than that using the reduction-acetylation method used previously.

3.5 Conclusion

In conclusion, the “active-latent” glycosylation strategy discussed above offers the possibility to prepare complex oligosaccharides by a highly convergent reiterative approach and extends the “armed-disarmed” glycosylation strategy described by Fraser-Reid et al.44

Fully or partially protected para-nitrophenyl thioglycosides proved to be very versatile reagents. The potential usefulness of the “latent” nature of nitro group was nicely illustrated by chemoselective glycosylation of partially benzoylated para-nitrophenyl thioglycosides with “active” thioglycosyl donors using NIS/TfOH as promoter. It was also established that a partially benzoylated para-nitrophenyl thioglycoside (“disarmed-latent” acceptor) could be condensed chemoselectively with a fully benzylated para-nitrophenyl thioglycoside (“armed-latent” donor) under the influence of NIS/TfOH. Therefore, the reactivity of a para-nitrophenyl thioglycosides toward glycosylation reaction could be regulated by the protecting group at C-2 (acyl type vs ether type) or can simply be “turned on” by transforming their electron withdrawing thioaryl substituents into electron donating group. A simple reduction and acetylation could effectively transform “latent” para-nitrophenyl thioglycosides into the corresponding “active” para-acetamidophenyl glycosides. The oxidation method (mCPBA) to convert para-nitrophenyl thioglycosides into the corresponding phenylsulfenyl glycosyl donors had limited value, at least in the case of disarmed donors. The effectiveness of this method needs further exploration.

The results discussed in this chapter clearly indicate that NIS-TfOH is a valuable promoter system for the chemoselective glycosylation of “latent” acceptor with “active”
The results discussed in this chapter clearly indicate that NIS-TfOH is a valuable promoter system for the chemoselective glycosylation of “latent” acceptor with “active” thioglycosyl donors. Furthermore, this study revealed that the amount of triflic acid used was crucial for the selective activation of “active” thioglycosides over relatively “latent” thioglycosides.

The combination of “active-latent” and “armed-disarmed” glycosidation methodology made it possible to manipulate the reactivity of both the glycosyl donors and acceptors by means of changing the electron withdrawing or electron donating ability of the protecting groups at the anomeric center (active-latent) and at the C-2 position (armed-disarmed). The versatile chemistry allowed us to prepare complex oligosaccharides in a highly convergent manner. This strategy will be advantageous for the synthesis of still more complex oligosaccharides. Actually, this “active-latent” glycosylation strategy has been successfully applied to the synthesis of sialosides such as GM₃, this will be discussed in the following chapter.
3.6 Experimental

3.6.1 Synthesis of 2-deoxy-2-phthalimido-1-thio-β-D-glucopyranosides using Lewis acid catalyzed method

*Ethyl 3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 32*

Titanium tetrachloride (TiCl₄) (1.5 mL) was added to a stirred mixture of 1,3,4,6,-tetra-O-acetyl-2-deoxy-2-phthalimido-β-D-glucopyranose 31\(^{190}\) (5 g, 10.47 mmol), ethane-thiol (1.6 mL, 21.63 mmol), and ground molecular sieves (4 Å, 7.5 g) in methylene chloride (50 mL) at 0 °C (ice bath). After 1 hour at room temperature, the mixture was filtered through a layer of Celite, washed with ice-cold 1 M sulfuric acid, aqueous sodium bicarbonate and water, dried (Na₂SO₄), and concentrated. The residue was crystallized from ether-hexane to give 32 as needles (3.7 g) in 74% yield: m.p. 116.5-117.6 °C; [α]ₐ +46.8° (C = 1.0, CHCl₃); Lit.\(^{43}\) m.p. 118-119 °C; [α]ₐ +44° (C = 1.0, CH₂Cl₂); Cl-MS (ether) gave m/z (ion, relative intensity): 479.8 ([M+1]+, 2.8%), 417.9 ([M+1-EtSH]+, 28.4%), 358.0 ([M+1-SPhOEt-AcOH]+, 62.5%), 297.8 ([M+1-SEt-2 (AcOH)]+, 100%); \(^1\)H-NMR (CDCl₃) δ (ppm): 7.86-7.69 (m, 4H, Phth), 5.80 (dd, 1H, J₃,₄ = 9.2 Hz, H-3), 5.45 (d, 1H, J₁₂ = 10.6 Hz, H-1), 5.15 (dd, 1H, J₄,₅ = 10.2 Hz, H-4), 4.25 (dd, 1H, J₂₃ = 10.3 Hz, H-2), 4.30 (dd, 1H, J₆,₆₂ = 12.4 Hz, H-6a), 4.14 (dd, 1H, J₅,₆₃ = 2.3 Hz, H-6b), 3.86 (ddd, 1H, H₅,₆₅ = 4.7 Hz, H-5), 2.65 (m, 2H, SCH₂), 2.08, 2.00, 1.83 (s, 9H, 3xOAc), 1.18 (t, 3H, J = 7.4 Hz, SCH₂CH₃); \(^1^3\)C-NMR (CDCl₃) δ (ppm): 170.6, 170.0, 169.4 (3xOAc), 167.7, 167.1 (C=O, Phth.), 134.3 (2C, C-ortho), 131.5, 131.1 (C-ipso), 123.7 (2C, C-meta), 81.1 (C-1), 75.9 (C-5), 71.5 (C-3), 68.8 (C-4), 62.2 (C-6), 53.6 (C-2), 24.3 (SCH₂), 20.8, 20.6, 20.4 (3xMe, Ac), 14.9 (SCH₂CH₃).

General procedure for the preparation of compounds 33-36:

Tin (IV) chloride (1 mL) was added to a stirred mixture of 1,3,4,6-tetra-O-acetyl-2-deoxy-2-phthalimido-β-D-glucopyranose 31 (1 equiv.), arylthiol (2 equiv.) and ground molecular sieves (4 Å) in dichloromethane (30 mL) at 0 °C. The mixture was stirred under nitrogen at room temperature for 4-6 hours. The mixture was filtered through a layer of celite, washed with ice-cold 1M sulfuric acid, aqueous sodium bicarbonate, and water. The organic phase was dried with sodium sulfate, evaporated under reduced pressure and coevaporated with toluene three times. The residue was purified by silica gel column chromatography or directly crystallized from ether-hexane.

Phenyl 3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 33

The residue was crystallized from ether-hexane to afford pure crystalline 33 in 73% yield: m.p. 145.7-146.2 °C; [α]D +52.8° (C = 1.0, CHCl3); CI-MS (ether) gave m/z (ion, relative intensity): 418 ([M-SPh]⁺, 21.9%), 358 ([M-SPh-AcOH]⁺, 47.6%), 298 ([M-SPh-2 (AcOH)]⁺, 100%), 240 ([M-SPh-AcOH-2 (AcO)]⁺, 62.1%); ¹H-NMR CDCl₃ δ (ppm), 7.81-7.73 (m, 4H, phth), 7.71-7.25 (m, 5H, phenyl), 5.78 (dd, 1H, J₁₂ = 9.2 Hz, H-3), 5.70 (d, 1H, J₁₂ = 10.5 Hz, H-1), 5.12 (dd, 1H, J₄₅ = 10.2 Hz, H-4), 4.33 (dd, 1H, J₂₂ = 10.2 Hz, H-2), 4.27 (dd, 1H, J₆₆₆ = 12.3 Hz, H-6a), 4.19 (dd, 1H, H-6b), 3.89 (ddd, 1H, J₆₆₆ = 5.0, J₆₆₆ = 2.5 Hz, H-5). 2.06, 2.01, 1.82 (s, 3xOAc); ¹³C-NMR (CDCl₃) δ (ppm): 170.6, 170.0, 169.4 (3s, 9H, OAc), 168.4, 167.6 (Phth), 134.4, 134.3, 133.2, 130.9, 128.8, 128.4, 123.7 (C-aromatic), 83.0 (C-1), 75.8 (C-5), 71.6 (C-3), 68.6 (C-4), 62.2 (C-6), 53.5 (C-2), 20.7, 20.6, 20.3 (3xAc).

Para-Methylphenyl 3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 34

Compound 34 was crystallized from methylene chloride-diethyl ether-hexane and gave white needles in 74% yield: m.p. 168.0-168.4 °C; [α]D +40.6° (C = 1.0, CHCl3); CI-MS (ether) gave m/z (ion, relative intensity): 482 ([M-AcO]⁺, 1.5%), 418 ([M-SPhMe]⁺, 25.8%), 358 ([M-SPh-SPhMe-AcOH]⁺, 66.6%), 298 ([M-SPhMe-2(AcOH)]⁺, 100%),
Para-Methoxyphenyl 3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 35

Compound 35 was crystallized from diethyl ether in 73 % yield: m. p. 140.2-140.5 °C; [α]D +20.1° (C = 1.0, CHCl3); CI-MS (ether) gave m/z (ion, relative intensity): 558 ([M+1]⁺, 0.3%), 418 ([M+1-SPhOMe]⁺, 22.4%), 358 ([M+1-SPhOMe-AcOH]⁺, 62.5%), 298 ([M+1-SPhOMe-2 (AcOH)]⁺, 100%); ¹H-NMR (CDCl3) δ (ppm): 7.88-7.71 (m, 4H, Phth.), 7.35-6.76 (m, 4H, Ph), 5.73 (dd, 1H, J₃,₄ = 9.7 Hz, H-3), 5.55 (d, 1H, J₁₂ = 10.4 Hz, H-1), 5.07 (dd, 1H, J₄,₅ = 9.7 Hz, H-4), 4.25 (dd, 1H, J₂,₃ = 9.8 Hz, H-2), 4.29-4.13 (m, 2H, H-6a, H-6b), 3.83 (ddd, 1H, J₄,₅ = 9.7, H₅₆₆ = 4.5, H₅₈₈ = 2.7 Hz, H-5), 3.77 (s, 3H, OMe), 2.07, 1.98, 1.80 (3s, 9H, OAc); ¹³C-NMR (CDCl3) δ (ppm): 170.6, 170.1, 169.4 (3xOAc), 167.8, 167.0 (C=O, Phth), 136.5 - 114.4 (12C, C-aromatic), 83.0 (C-1), 75.8 (C-5), 71.7 (C-3), 68.6 (C-4), 62.1 (C-6), 55.3 (OMe), 53.5 (C-2), 20.8, 20.6, 20.4 (AcO).

Para-Nitrophenyl 3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 36

Compound 36 was crystallized from methylene chloride-diethyl ether. Compound 36 (1.09 g) was obtained in 91% yield: m. p. 217.2-217.5 °C; [α]D +65.7° (c = 0.68, CHCl3); CI-MS (ether) gave m/z (ion, relative intensity): 420 ([M+1-SPhNO₂]⁺, 2.3%), 358 ([M+1-HSPhNO₂-AcOH]⁺, 11.3%), 298 ([M+1-HSPhNO₂ -2AcOH]⁺, 79.9%); IR
(thin film, ν<sub>cm-1</sub>): 1749, 1719, 1580, 1518, 1379, 1342, 1230, 1077, 1039, 911, 750, 720; 1H-NMR (CDCl<sub>3</sub>) δ (ppm): 8.11-7.48 (m, 8H, aromatic H), 5.85 (d, 1H, J<sub>1,2</sub> = 10.6 Hz, H-1), 5.81 (dd, 1H, J<sub>3,4</sub> = 9.2 Hz, H-3), 5.13 (dd, 1H, J<sub>4,5</sub> = 10.2 Hz, H-4), 4.39 (dd, 1H, J<sub>2,3</sub> = 10.2 Hz, H-2), 4.29 (dd, 1H, J<sub>6a,b</sub> = 12.4 Hz, H-6a), 4.20 (1H, H-6b), 3.98 (ddd, 1H, H<sub>5,6a</sub> = 5.2, H<sub>5,6b</sub> = 2.3 Hz, H-5), 2.10, 2.02, 1.82 (3s, 9H, OAc); 13C-NMR (CDCl<sub>3</sub>) δ (ppm): 170.4, 170.0, 169.4 (3xOAc), 168.4, 167.7 (phthalimido), 147.0, 141.1, 134.6, 131.2, 123.8 (C-aromatic), 81.9 (C-1), 76.2 (C-5), 71.3 (C-3), 68.4 (C-4), 62.1 (C-6), 53.3 (C-2), 20.9, 20.6, 20.4 (3xAc).

**Imidazolin-2-yl 3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 37**

Tin (IV) chloride (275 µL) was added to a stirred mixture of 31 (700 mg, 1.47 mmol), 2-mercapto-1-methyl-imidazole (335 mg, 2.94 mmol) and ground molecular sieves (1.0 g, 4 Å) in dichloromethane (10 mL) at 0 °C. The solution was then allowed to attain room temperature and stirred overnight and filtered through a pad of celite, washed with ice-cold 1M sulfuric acid, aqueous sodium bicarbonate, and water. The organic phase was dried with sodium sulfate, evaporated under reduced pressure, and coevaporated with toluene three times. Crude product was purified by chromatography using ethyl acetate-hexane (1:1) as eluent to give pure 37 (281 mg) in 51% yield: m.p. 81.5-82.7 °C; [α]<sub>β</sub> +36.0° (c = 0.68, CHCl<sub>3</sub>); (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 532.2 ([M+H]+, 18.4%); IR (thin film, ν<sub>cm-1</sub>): 2953, 1748, 1719, 1460, 1379, 1232, 1078, 1041, 913, 726; 1H-NMR (CDCl<sub>3</sub>) δ (ppm): 8.11-8.07 (m, 2H, Ph-meta), 7.85-7.81 (m, 2H, Phth-meta), 7.77-7.72 (m, 2H, Phth-ortho), 7.86-7.68 (m, 4H, Phth), 7.06 (d, 1H, J = 1.2 Hz, imidazoline), 6.96 (d, 1H, imidazoline), 5.80 (d, 1H, J<sub>1,2</sub> = 10.6 Hz, H-1), 5.74 (dd, H-1, J<sub>3,4</sub> = 9.2 Hz, H-3), 5.09 (dd, 1H, J<sub>4,5</sub> = 9.2 Hz, H-4), 4.34 (dd, 1H, J<sub>2,3</sub> = 10.2 Hz, H-2), 4.21 (dd, 1H, J<sub>5,6a</sub> = 4.8, J<sub>6a,6b</sub> = 12.5 Hz, H-6a), 4.11 (1H, J<sub>5,6b</sub> = 2.5 Hz, H-6b), 3.4 (ddd, 1H, H-5), 3.65 (s, 3H, NHAc), 2.04, 1.98, 1.81 (3s, 9H, OAc); 13C-NMR (CDCl<sub>3</sub>) δ (ppm): 173.6, 170.4, 169.9 (3xOAc), 167.6, 166.9 (C=O, Phth), 135.2-123.7 (10C, Phth).
imidazoline), 83.0 (C-1), 75.9 (C-5), 71.4 (C-3), 68.4 (C-4), 61.9 (C-6), 53.7 (C-2), 34.2 (NHAc), 20.7, 20.6, 20.3 (OAc).

3.6.2 Synthesis of partially protected 2-deoxy-2-phthalimido-1-thio-β-D-glucopyranosides

**Ethyl 4,6-O-benzylidene-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 38**

To a suspension of ethyl 3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 32 (3.0 g, 6.26 mmol) in methanol (100 mL), sodium methoxide in methanol (0.3 mL, 1.0 M) was added. After 2 hours, acetic acid (1 mL) was added to the solution. The solution was concentrated, toluene was distilled from the residue. The crude product was then dissolved in N,N-dimethylformamide (20 mL) containing α,α-dimethoxytoluene (1.8 mL). p-Toluenesulfonic acid (180 mg, 0.18 eq) was added. The mixture was stirred at 50 °C for 1 hour, cooled and partitioned between aqueous sodium bicarbonate and toluene-ethyl ether (3:1). The organic layer was washed with water, dried (Na₂SO₄), treated with silica gel for 5 min, filtered and concentrated. Recrystallisation from ethyl ether-dichloromethane-hexane gave 38 (2.35 mg) as prisms in 85% yield: m.p. 167.8-168.4 °C; [α]D -10.1° (c = 1.1, CHCl₃); IR (thin film, ν̃ cm⁻¹): 3468, 2874, 1774, 1711, 1612, 1468, 1384, 1092, 1043, 989, 920, 873, 760, 721, 700; CI-MS (ether) gave m/z (ion, relative intensity): 442 ([M+1]⁺, 32.9%), 380 ([M+1-EtSH]⁺, 100%), 362 ([M+1-EtSH-H₂O]⁺, 79.7%), 336 ([M+1-PhCHO]⁺, 27.0%), 274 ([M+1-PhCHO-EtSH]⁺, 100%); ¹H-NMR (CDCl₃) δ (ppm): 7.86-7.34 (m, 9H, Aromatic), 5.56 (s, 1H, PhCH), 5.40 (d, 1H, J₁₂ = 10.5 Hz, H-1), 4.66 (dd, 1H, J₃,₄ = 8.8 Hz, H-3), 4.39 (dd, J₆₆₆ = 10.1 Hz, H-6a), 4.32 (dd, 1H, J₂,₃ = 10.1 Hz, H-2), 3.80 (1H, H-6b), 3.70 (ddd, J₅₆₅ = 4.4, J₅₆₆ = 9.9 Hz, H-5), 3.61 (dd, J₄,₅ = 9.0 Hz, H-4), 2.74-2.61 (m, 2H, SCH₂), 1.70 (br., 1H, OH), 1.18 (t, 3H, J = 7.5 Hz, Me); ¹³C-NMR (CDCl₃) δ (ppm): 168.2, 167.7 (C=O Phthalimido), 136.9-123.3 (Aromatic), 101.9 (PhCH), 82.1 (C-4), 81.3 (C-1), 70.3 (C-5), 69.5 (C-3), 68.6 (C-6), 55.4 (C-2), 24.1 (SCH₂), 14.8 (CH₃).
Para-Nitrophenyl 4,6-O-benzylidene-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 39

To a suspension of para-nitrophenyl 3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 36 (4.0 g, 6.99 mmol) in methanol (100 mL), sodium methoxide in methanol (0.3 mL, 1.0 M) was added. After stirring for 2 hours at room temperature, the reaction was quenched with H⁺ resin (Dowex 50w-X8) and then filtered. The filtrate was evaporated under reduced pressure. Toluene was added and distilled from the residue. The crude product was then dissolved in dry acetonitrile (20 mL) containing α,α-dimethoxytoluene (3.0 mL). p-TsOH (180 mg, 0.18 eq) was added. The mixture was stirred for 50 min at room temperature. TLC (4% ethanol in benzene) showed complete conversion of starting material 34 (Rf = 1.7) to product 39 (Rf = 0.48). The reaction mixture was filtered and concentrated under reduced pressure. The residue was purified by silica gel column chromatography using 2% methanol in methylene chloride as eluent to afford 39 (4.15 g) in 90% yield: m.p. 150-152 °C; [α]D +72° (c = 1.0, CHCl₃); IR (thin film, νcm⁻¹): 3466, 1712, 1581, 1516, 1471, 1384, 1341, 1091, 873, 721; CI-MS (ether) gave m/z (ion, relative intensity): 534.8 ([M][⁺], 31.6%), 379.9 ([M-HSPhNO₂][⁺], 71.9%);

¹H-NMR (CDCl₃) δ (ppm): 8.12-7.29 (m, 9H, Aromatic), 5.80 (d, 1H, J₁₂ = 10.5 Hz, H-1), 5.55 (s, 1H, PhCH), 4.64 (dd, 1H, J₃₂ = 8.8 Hz, H-3), 4.38 (dd, 1H, H-6a), 4.36 (dd, 1H, J₂₂ = 9.9 Hz, H-2), 3.85-3.74 (m, 2H, H-5, H-6b), 3.60 (dd, J₄₅ = 8.9 Hz, H-4), 2.68 (br, 1H, OH); ¹³C-NMR (CDCl₃) δ (ppm): 168.2, 167.4 (C=O Phth), 146.7-123.5 (12C, Aromatic), 101.9 (PhCH), 82.7 (C-4), 81.6 (C-1), 70.5 (C-5), 69.4 (C-3), 68.4 (C-6), 55.9 (C-2).

Ethyl 3-O-benzyl-4,6-O-benzylidene-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 40

To a solution of ethyl 4,6-O-benzylidene-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 32 (1.0 g, 2.3 mmol) in dry N,N-dimethylformamide (10 mL) was added grounded molecular sieve (1.0 g, 4 Å), sodium hydride (2.2 g, 50% in mineral oil, washed three time with hexane, 4.1 mmol) and the mixture was stirred for 15 min. To this mixture
was added benzyl bromide (0.5 mL, 0.41 mol) at 0 °C (ice bath) and the reaction mixture was stirred at room temperature for 6 hours. The mixture was quenched with ice-water and extracted with toluene-ethyl ether (3:1). The organic phase was washed with saturated sodium bicarbonate, water, dried over sodium sulfate and concentrated. The residue was purified by chromatography on silica gel using ethyl acetate-hexane 1:5 as eluent to afford 40 (1.03 g) in 85% yield. The product was crystallized from ethyl ether-hexane to give needles: m.p. 95.7-96.5 °C; [α]_D +62° (c = 0.95, CHCl₃); Lit.⁴³ [α]_D +66° (c = 1.0, CHCl₃); CI-MS (ether) gave m/z (ion, relative intensity): 532 ([M]^+, 17.7%), 470 ([M-EtSH]^+, 60.4%), 426 ([M-PhCHO]^+, 41.6%), 364 ([M-EtSH-PhCHO]^+, 96.1%), 362 ([M-EtSH-PhCH₂OH]^+, 100%); IR (thin film) ν: 3032, 2893, 1774, 1714, 1612, 1496, 1457, 1380, 1261, 1172, 1087, 1002, 917, 874, 793, 751, 721, 700, 660 cm⁻¹; ¹H-NMR (CDCl₃) δ (ppm): 7.87-6.83 (m, 14H, aromatic), 5.62 (s, 1H, PhCH), 5.33 (d, 1H, J₁,₂ = 10.4 Hz, H-1), 4.64 (AB pattern, 2H, J₆₆,₆₇ = 12.3 Hz), 4.42 (dd, 1H, J₂₃ = 10.2 Hz, H-3), 4.41 (dd, J₆₆,₆₇ = 10.1 Hz, H-6a), 4.28 (dd, 1H, J₃₄ = 10.0 Hz, H-2), 3.83 (dd, 1H, H-6b), 3.80 (dd, 1H, J₄₅ = 10.0 Hz, H-4), 3.69 (ddd, J₅₆₇ = 4.9, J₆₃₆₀ = 4.4 Hz, H-5), 2.63 (m, 2H, SCH₂), 1.15 (t, 3H, CH₃); ¹³C-NMR (CDCl₃) δ (ppm): 167.6, 167.3 (C=O Phth), 137.8-123.3 (Aromatic), 101.3 (PhCH), 83.0 (C-4), 81.7 (C-1), 75.4 (C-3), 74.1 (CH₂), 70.4 (C-5), 68.7 (C-6), 54.6 (C-2), 24.0 (SCH₂), 14.8 (CH₃, ethyl).

**Ethyl 3,6-di-O-benzyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 41**

Diethyl ether saturated with hydrogen chloride was added dropwise, at 0 °C (ice bath) to a stirred mixture of compound 40 (1.0 g, 1.88 mmol), sodium cyanoboroxydrde (710 mg, 11.28 mmol, 6 eq) and molecular sieves (1.2 g, 3 Å) in tetrahydrofuran (30 mL) until the mixture was acidic (as determined with pH paper and gas evolution). After the reaction mixture was stirred at 0 °C for 15 min, TLC showed a complete reaction. The reaction mixture was then poured into ice-water, and the product was extracted with dichloromethane. The extracts were washed with saturated sodium bicarbonate, dried over sodium sulfate and concentrated in vacuo. The crude product was purified by column
chromatography on silica gel (ethyl acetate-hexane, 2:5) to afford 37 (825 mg) in 82% yield. The product was jelly-like and solidified in one week: m.p. 109.3-110.5 °C; [α]D +40° (c = 0.85, CHCl3); lit.157a m.p. 110 °C; [α]D +43° (c = 1.5, CHCl3); M.S. (pos FAB) (rel intensity) (M/Z): 534 ([M]+, 1.2%), 472 ([M-EtSH]+, 7.3%), 364 ([M-EtSH-PhCH2OH]+, 3.4%); IR (thin film) v: 3468, 2903, 1774, 1711, 1611, 1496, 1453, 1386, 1081, 874, 721, 700 cm⁻¹; 1H-NMR (CDCl3) δ (ppm): 7.81-6.91 (m, 14H, aromatic), 5.26 (d, 1H, J₁₂=10.2 Hz, H-1), 4.76-4.51 (m, 4H, 2xOCH₂Ph), 4.25 (dd, 1H, J₃,₄ = 8.2 Hz, H-3), 4.21(dd, 1H, J₂,₃=10.1 Hz, H-2), 3.82 (dd, 1H, J₆,₈= 10.1 Hz, H-6a), 3.80 (dd, 1H, J₄,₅ = 9.5 Hz, H-4), 3.76 (dd, 1H, H-6b), 3.67 (ddd, 1H, J₅,₆₈ = 4.8, J₅,₆₉ = 5.2 Hz, H-5), 3.00 (br., 4-OH), 2.68-2.54 (m, 2H, SCH₂), 1.15 (t, 3H, CH₃); 13C-NMR (CDCl3) δ (ppm): 168.1, 167.5 (C=O Phth), 138.1-123.3 (Aromatic), 81.2 (C-1), 79.6 (C-3), 77.7 (C-5), 74.5 (OCH₂Ph), 74.8 (C-4), 73.8 (OCH₂Ph), 70.8 (C-6), 54.4 (C-2), 24.0 (SCH₂), 14.9 (CH₃).

**Ethyl 2-deoxy-2-phthalimido-3,6-di-O-pivaloyl-1-thio-β-D-glucopyranoside 44**

To a suspension of ethyl 3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 32 (1.5 g, 4.17 mmol) in methanol (60 mL) was added 1M sodium methoxide in methanol (200 μL). After 35 min, TLC (MeOH/CH₂Cl₂, 1:9 v/v) showed that the Zemplén deacetylation was completed. The solution was neutralized with H⁺ resin (Dowex 50w-X8), filtered and concentrated under reduced pressure. Toluene was added and distilled from the residue. The product was then dissolved in dry pyridine (20 mL) and cooled to 0 °C followed by the addition of pivaloyl chloride (1.21 mL, 10 mmol). The mixture was allowed to attain room temperature and the stirring was continued for 48 hours. The reaction mixture was then quenched with ice water and extracted with methylene chloride (20 mL x2). The extracts were washed with sodium bicarbonate, water and saturated sodium chloride, dried (Na₂SO₄), filtered, and concentrated under reduced pressure. The residue syrup was purified by column chromatography on silica gel using 10-50% gradient of ethyl acetate in hexane, to afford dipivaloyl-β-D product 44 (Rf = 0.80, ethyl acetate/hexane 1:1) (760 mg) in 35% yield and monopivaloyl-β-D product 43 (Rf = 0.80, ethyl acetate/hexane 1:1) (320 mg) in 19% yield.
0.33) (822 mg) in 45% yield. Compound 44 was recrystallised from ether-hexane gave prisms: m.p. 123.8-124.6 °C; [α]D -12.2° (c = 1.0, CHCl₃); CI-MS (ether) gave m/z (ion, relative intensity): 552.0 ([M+1]⁺, 83.3%), 459.9 ([M+1-EtSH]⁺, 39.9%), 357.9 ([M+1-EtSH-(CH₃)₂C(O)OH])⁺, 100%); ¹H-NMR (CDCl₃) δ (ppm): 7.83 (m, 2H, H-ortho, Phth), 7.73 (m, 2H, H-meta, Phth), 5.64 (dd, 1H, J₃,₄ = 9.0 Hz, H-3), 5.45 (d, 1H, J₁₂ = 10.5 Hz, H-1), 4.44 (dd, J₆,₈ = 12.1 Hz, H-6a), 4.38 (dd, 1H, J₅,₆b = 4.9 Hz, H-6b), 4.31 (dd, 1H, J₂,₃ = 10.4 Hz, H-2), 3.76 (ddd, 1H, J₅,₆a = 2.7 Hz, H-5), 3.57 (dd, J₄,₅ = 9.7 Hz, H-4), 2.60 (m, 2H, SCH₂CH₃), 1.23 (s, 9H, tBu), 1.22 (t, 3H, J = 7.4 Hz, SCH₂CH₃); ¹³C-NMR (CDCl₃) δ (ppm): 179.1, 178.8 (C=O, Piv), 167.67, 167.3 (C=O, Phth), 134.3-123.5 (C-aromatic, Phth), 80.8 (C-1), 78.4 (C-5), 73.9 (C-3), 70.3 (C-4), 63.4 (C-6), 53.4 (C-2), 38.9, 38.7 (C(O)C(CH₃)₃), 27.2 (3C, tBu), 26.7 (3C, tBu), 24.1 (SCH₂), 15.0 (CH₃).

3.6.3 Synthesis of “Active-Latent” β-D-galactopyranosyl donors and acceptors

Phenyl 1-thio-β-D-galactopyranoside 46

Compound 8 (2.0 g, 4.1 mmol) was deacetylated using the standard Zemplén deacetylation procedure. The resulting residue was purified by silica gel chromatography using methanol-chloroform (9:1, v/v) as eluent to afford 46 (1.17 g) in 96% yield. The pure 46 was recrystallised from ethanol: m.p. 120.5-121.3 °C; (ethanol); [α]D -51.0° (c = 1.15, CH3OH); IR (thin film, νcm⁻¹): 3383 (br), 1345, 1056, 865, 745, 693; CI-MS (ether) gave m/z (ion, relative intensity): 273.3 ([M+1]⁺, 29.4%), 255.2 ([M+1-H2O]⁺, 79.4%),
163.3 ([M+1-PhSH]⁺, 97.9%); ¹H-NMR (CDCl₃) δ (ppm): 7.63-7.55 (m, 2H, H-meta), 7.49-7.37 (m, 3H, H-ortho, H-para); 4.82 (d, 1H, J₁,₂ = 9.3 Hz, H-1), 4.74-3.60 (m, 6H, H-2, 3, 4, 5, 6a, 6b); ¹³C-NMR (CDCl₃) δ (ppm): 135.8 (C-ipso), 134.0 (C-2C, C-meta), 132.4 (2C, C-ortho), 130.8 (C-para), 91.1 (C-1), 81.9 (C-5), 77.0 (C-3), 72.2 (C-4), 71.7 (C-2), 63.9 (C-6).

Para-Nitrophenyl 1-thio-β-D-galactopyranoside 47

To a suspension of 9 (10.0 g, 20.6 mmol) in methanol (100 mL) was added 1 M NaOMe (1.5 mL) (pH = 9-10). The mixture was stirred at room temperature for 50 min, TLC (1/10, MeOH/CHCl₃) showed that the Zemplén deacetylation was finished. The solution was neutralized with H⁺ resin (Dowex 50w-X8) and evaporated under reduced pressure to afford 47 (6.28 g) in 96% yield. The product was recrystallised from ethanol: m.p. 160.2-161.5 °C; [α]D -100.8° (c = 1.0, CH3OH); CI-MS (ether) gave m/z (ion, relative intensity): 318 ([M+1]⁺, 1.1%), 163 ([M+1-SPhNO₂]⁺, 38.3%); ¹H-NMR (D₂O) δ (ppm): 8.17 (d, J₆,₇ = 9.1 Hz, H-meta), 7.63 (d, H-ortho), 5.02 (d, 1H, J₁,₂ = 9.7 Hz, H-1), 4.06 (d, 1H, J₃,₄ = 2.0 Hz, H-4), 3.92-3.69 (m, 5H, H-2, H-3, H-5, H-6a, H-6b); ¹³C-NMR (D₂O) δ (ppm): 148.2 (C-para), 146.6 (C-ipso), 130.9 (C-meta), 126.6 (C-ortho), 88.6 (C-1), 81.6 (C-5), 76.4 (C-3), 71.5 (C-4), 71.1 (C-2), 63.4 (C-6).
Ethyl 2,3,4,6-tetra-O-benzoyl-1-thio-β-D-galactopyranoside 48

Tin (IV) chloride (0.5 mL) was added to a stirred mixture of 1,2,3,4,6-penta-O-benzoyl-β-D-galactopyranoside (701 mg, 1 mmol), ethanethiol (0.5 mL, 6.75 mmol), and ground molecular sieve (4Å, 1 g) in methylene chloride (10 mL) at 0 °C (ice bath). After 1 hour at room temperature, the mixture was filtered through a layer of celite, washed with ice-cold 1 M sulfuric acid, aqueous sodium bicarbonate and water, dried (Na₂SO₄), and concentrated. The residue was purified by silica gel column chromatography (ethyl acetate-hexane, 1:4) to afford 48 (531 mg) in 83% yield: m.p. 101-102 °C; [α]D +110.2° (c = 1.0, CHCl₃); M.S. (C.I. ether) (M/Z): 640.9 ([M]+, 2.7%), 578.9 ([M-EtSH]⁺, 100%); 1H-NMR (CDCl₃) δ (ppm): 8.10-7.18 (20H, aromatic), 6.00 (dd, 1H, J₄,₅ <1.0 Hz, H-4), 5.85 (dd, 1H, J₂,₃ = 9.9 Hz, H-2), 5.60 (dd, 1H, J₃,₄ = 3.3 Hz, H-3), 4.86 (d, 1H, J₁₂ = 9.7 Hz, H-1), 4.65 (m, 1H, H-6a), 4.59-4.30 (m, 2H, H-5, H-6b); 13C-NMR (CDCl₃) δ (ppm): 165.1, 165.7, 165.5, 165.4 (4xC=O, Bz), 133.5-128.3 (C-aromatic), 88.2 (C-1), 82.9 (C-5), 81.1 (C-3), 77.9 (C-4), 70.2 (C-2), 63.5 (C-6).

Anal. Calcd for C₃₆H₃₂O₅S (640.68): C, 67.49; H, 5.03. Found: C, 67.54; H, 5.01.

Phenyl 2,3,4,6-tetra-O-benzoyl-1-thio-β-D-galactopyranoside 49

To a solution of 2,3,4,6-tetra-O-benzoyl-β-D-galactopyranosyl bromide (6.65 g, 10.08 mmol.), TBAHS (5.1 g, 1.5 equiv.) and thiophenol (2.08 mL, 20.16 mmol, 2 equiv.) in ethyl acetate (100 mL) was added 1M aq Na₂CO₃ (100 mL). The two phase reaction mixture was stirred vigorously at room temperature for 50 min. The mixture was diluted with ethyl acetate (100 mL) and the organic layer was washed with saturated sodium bicarbonate, water (3x50 mL), dried (Na₂SO₄), filtered and concentrated under reduced pressure. The residue was purified from silica gel chromatography (ethyl acetate-hexane 1:3) to give 49 (6.64 g) in 96% yield: [α]D +92.2° (c = 1.0, CHCl₃); CI-MS (ether) gave m/z (ion, relative intensity): 688.8 ([M]+, 1.9%), 579.0 ([M-SPh]⁺, 95%); IR (thin film, νcm⁻¹): 3065, 2960, 1727, 1600, 1451, 1268, 1100, 1069, 1027, 709; 1H-NMR (CDCl₃) δ (ppm): 8.05-7.10 (25H, aromatic), 6.00 (dd, 1H, J₄,₅ <1.0 Hz, H-4), 5.77 (dd, 1H, J₂,₃ = 9.9 Hz, H-2), 5.60 (dd, 1H, J₃,₄ = 3.2 Hz, H-3), 5.04 (d, 1H, J₁₂ = 9.7 Hz, H-1), 4.64 (m,
1H, H-6a), 4.48-4.41 (m, 2H, H-5, H-6b); $^{13}$C-NMR (CDCl$_3$) $\delta$ (ppm): 166.0, 165.4, 165.3, 165.1 (4xC=O, Bz), 138.9-123.2 (C-aromatic), 85.8 (C-1), 75.1 (C-5), 72.9 (C-3), 67.3 (C-2), 67.8 (C-4), 62.5 (C-6).

Para-Nitrophenyl 2,3,4,6-tetra-O-benzoyl-1-thio-$\beta$-D-galactopyranoside 50

Para-nitrophenyl 1-thio-$\beta$-D-galactopyranoside 47 (0.5 g, 1.6 mmol) was dissolved in dry pyridine (8 mL). Benzoyl chloride (1.1 mL, 9.6 mmol) and a catalytic amount of 4-dimethylaminopyridine were added. The solution was stirred at 0 $^\circ$C for 1 hour, and was then allowed to attain to room temperature for an additional 3 hours. TLC (ether, 100%) showed that the reaction was complete. The reaction mixture was then quenched with ice water and extracted with methylene chloride (10 mL x2). The extracts were washed with sodium bicarbonate, water and saturated sodium chloride. The organic phase was dried (Na$_2$SO$_4$), filtered, concentrated under reduced pressure and coevaporated with toluene (2x20 mL). The product was crystallized form diethyl ether-hexane mixture (10 mL, 1:1) to afford 50 (1.03 g) in 89% yield as needles: m.p. 157-159 $^\circ$C; $[\alpha]_D$ +76.5$^o$ (c = 1.0, CHCl$_3$); IR (thin film, $\nu_{cm^{-1}}$): 3067, 2966, 1727, 1600, 1582, 1518, 1452, 1342, 1269, 1099, 1069, 910, 852, 711; Cl-MS (ether) gave m/z (ion, relative intensity): 733.7 ([M]+, 3.3%), 579.2 ([M-H$\text{HSPHNO}_2$]+, 100%); $^1$H-NMR (CDCl$_3$) $\delta$ (ppm): 8.03-7.19 (m, 24H, aromatic), 6.03 (dd, 1H, J$_{4,5} < 1.0$ Hz, H-4), 5.82 (dd, 1H, J$_{2,3} = 9.9$ Hz, H-2), 5.66 (dd, 1H, J$_{3,4} = 3.3$ Hz, H-3), 5.17 (d, 1H, J$_{1,2} = 9.9$ Hz, H-1), 4.64 (dd, 1H, H$_{5,6a} = 7.2$, J$_{6a,6b} = 11.3$ Hz, H-6a), 4.53(dd, J$_{5,6b} = 4.5$ Hz, H-6b), 4.47 (m, 1H, H-5); $^{13}$C-NMR (CDCl$_3$) $\delta$ (ppm): 165.9, 165.3(2C), 165.1 (C=O, 4xBz, 146.9 (C-para), 141.5 (C-ipso), 133.9 - 123.7 (28C, aromatic), 84.6 (C-1), 75.6 (C-5), 72.5 (C-3), 68.2 (C-4), 67.5 (C-2), 62.6 (C-6).

Anal. Calcd for C$_{40}$H$_{31}$O$_{11}$NS (733.75): C, 65.48; H, 4.26; N, 1.91; S, 4.37. Found: C, 65.61; H, 4.46; N, 1.92; S, 4.20.
Para-Nitrophenyl 6-O-t-butyldimethylsilyl-2,3,4-tri-O-pivaloyl-1-thio-β-D-galactopyranoside 60

To a solution of 47 (1.2 g, 3.79 mmol) in dry pyridine (10 mL) was added t-butyldimethylsilyl chloride (0.742 g, 4.92 mmol) at 0°C. The reaction mixture was then allowed to attain room temperature and stirred for 3 hours. TLC (8% methanol in dichloromethane) showed a clear conversion of starting material 47 to 6-O silylated intermediate. The reaction mixture was cooled to 0°C again and pivaloyl chloride (1.86 mL, 15 mmol) was added dropwise to the reaction mixture. The stirring was continued for additional 72 hours. TLC (Hexane-EtOAc, 4:1, v/v) showed that reaction was still not complete. The reaction temperature was raised to 70°C for additional 8 hours. The reaction mixture was then quenched with ice water and extracted with methylene chloride (20 mL x2). The extracts were washed with sodium bicarbonate, water and saturated sodium chloride, dried (Na₂SO₄), filtered, and concentrated under reduced pressure. Column chromatography on silica gel (ethyl acetate-hexane 1:8 v/v) of the residue gave tripivaloylated product 60 (1.32 g) in 53% yield (Rf = 0.47, EtOAc-hexane 1:8 v/v) and tetrapivaloylated product 51 (860 mg) in 36% yield (Rf = 0.32).

Compound 60 had: m.p. 121.5-123.4 °C; (ether-hexane); [α]D -22.0° (c = 1.0, CHCl₃); CI-MS (ether) gave m/z (ion, relative intensity): 683.9 ([M]+, 2.8%), 529.1 ([M-HSPhNO₂]+, 100%); ¹H-NMR (CDCl₃) δ (ppm): 8.13 (d, Jₘ₋₎ = 9.0 Hz, H-meta), 7.61 (d, H-ortho), 5.49 (dd, 1H, J₂₂ = 0.9 Hz, H-4), 5.26 (dd, 1H, J₂₃ = 9.9 Hz, H-2), 5.14 (dd, 1H, J₃₄ = 3.0 Hz, H-3), 4.81 (d, 1H, J₁₂ = 9.6 Hz, H-1), 3.86 (ddd, 1H, J₅₆a = 6.3 Hz, H-5), 3.72 (dd, 1H, J₆a₆b = 10.0 Hz, H-6a), 3.56 (dd, J₅b₆b = 6.7 Hz, H-6b), 1.18, 1.15, 1.06 (3s, 27 H, 3xtBu, Piv), 0.85 (s, 9H, tBu), 0.02, 0.01 (2s, 6H, =SiCH₃); ¹³C-NMR (CDCl₃) δ (ppm): 177.0, 176.4 (2C (C=O, Piva), 146.8 (C-para), 141.8 (C-ipso), 131.3 (2C, C-meta), 123.7 (C-ortho), 84.5 (C-1), 76.5 (C-5), 72.1 (C-3), 66.9 (C-2), 66.5 (C-4), 61.0 (C-6), 38.9, 39.7 (2C, 3xC(O)ₐ(C(CH₃)₃), 27.00 (9C, 3xtBu, Piv), 25.7 [3C, SiC(CH₃)₃], 18.1 (SiC(CH₃)₃), -5.6, -5.5 [2C, Si(CH₃)₃].

Para-Nitrophenyl 2,3,4,6-tetra-O-pivaloyl-1-thio-β-D-galactopyranoside 51

Compound 51 had: m.p. 132.5-133.4 °C; (CH₂Cl₂); [α]₀ -16.6° (c = 1.0, CHCl₃); CI-MS (ether) gave m/z (ion, relative intensity): 530.9 ([M⁺, 1.2%], 489.9 ([M⁺-HSPHNO₂]⁺, 100%); ¹H-NMR (CDCl₃) δ (ppm): 8.14 (d, Jₘₐₓ = 9.0 Hz, H-meta), 7.63 (d, H-ortho), 5.49 (dd, 1H, J₄,₅ = 2.2 Hz, H-4), 5.23 (dd, 1H, J₂,₃ = 9.3 Hz, H-2), 5.14 (dd, 1H, J₃,₄ = 2.9 Hz, H-3), 4.83 (d, 1H, J₁₂ = 9.9 Hz, H-1), 4.18 (dd, 1H, J₆,₇ = 8.9 Hz, H-6a), 4.08 (ddd, 1H, J₅,₆ = 5.4 Hz, H-5), 4.01 (dd, J₅,₆ = 4.2 Hz, H-6b), 1.17, 1.16, 1.15, 1.06 (4s, 36 H, 4xtBu, Piva); ¹³C-NMR (CDCl₃) δ (ppm): 177.6, 176.9, 176.5, 176.3 (4xC=O, Piva), 147.0 (C-paran), 141.2 (C-ipso), 131.8 (2C, C-meta), 123.6 (C-ortho), 84.3 (C-1), 75.0 (C-5), 71.7 (C-3), 66.8 (C-2), 66.2 (C-4), 61.3 (C-6), 38.9, 38.6 (3C), (4xC(O)C(CH₃)₃), 26.9 (12C, 3xtBu, Piv).

Para-Nitrophenyl 2,3,4,6-tetra-O-benzyl-1-thio-β-D-galactopyranoside 52

To para-nitrophenyl 1-thio-β-D-galactopyranoside 47 (634 mg, 2.0 mmol) in dry N,N-dimethyl formamide (5 mL) were added a sodium hydride dispersion (50% in oil, 768 mg, 16 mmol) and then benzyl bromide (1.46 mL, 12 mmol) at 0 °C. The mixture was allowed to attain room temperature and stirred for 4 hours. Methanol (1 mL) was added to destroy excess benzyl bromide, diluted with toluene-ether (3:1 v/v) 100 mL, and washed with 5% HCl solution (2x50 mL), dried, and concentrated under reduced pressure. The residue was recrystallised from ether-hexane (20 mL, 1:1 v/v) to give the desired product (1.0 g) and the mother liquors were concentrated and subject to column chromatography on silica gel (ethyl acetate-hexane 1:2) to give a second portion of product (90 mg) in a total yield (1.09 g) 81%; m.p. 99-100 °C; [α]₀ -34.0° (c = 1.0, CHCl₃); IR (KBr, νcm⁻¹): 3063, 3030, 2887, 1595, 1579, 1514, 1544, 1343, 1091, 910, 851, 740, 699; CI-MS (ether) gave m/z (ion, relative intensity): 525.0 ([M⁺+HSPHNO₂]⁺, 0.8%); ¹H-NMR (500 MHz, CDCl₃) δ (ppm): 7.86 (d, Jₘₐₓ = 9.0 Hz, H-meta), 7.58 (d, H-ortho), 7.35-7.26 (m, 22H, aromatic), 4.77-4.43 (m, 8H, 4xOCH₂), 4.73 (d, 1H, J₁₂ = 9.5 Hz, H-1), 4.01 (d 1H, J₄,₅ < 1.0 Hz, H-4), 4.00 (dd, 1H, J₂,₃ = 9.0 Hz, H-2), 3.67-3.61 (4H, H-3, H-5, H6a, H-6b); ¹³C-NMR (125.8 MHz, CDCl₃) δ (ppm): 165.1 (C=O, 4xBz,
145.9 (C-para), 144.4 (C-ipso), 138.3 - 123.8 (28C, aromatic), 84.7 (C-1), 84.2 (C-5), 84.0 (C-3), 76.7 (C-4), 75.8 (OCH<sub>2</sub>), 74.7 (OCH<sub>2</sub>), 73.7 (OCH<sub>2</sub>), 73.3 (C-2), 72.7 (OCH<sub>2</sub>), 68.7 (C-6).

Anal. Calcd for C<sub>46</sub>H<sub>39</sub>NO<sub>5</sub>S (677.82): C, 70.88; H, 5.80; N, 2.07; S, 4.73. Found: C, 71.07; H, 6.00; N, 2.07; S, 4.76.

**Phenyl 6-O-t-butyldimethylsilyl-1-thio-β-D-galactopyranoside 53**

Phenyl 1-thio-β-D-galactopyranoside 46 (0.5 g, 1.84 mmol) in dry pyridine (8 mL) was added t-butyldimethylsilyl chloride (332 mg, 2.21 mmol) at 0 °C (ice bath). The reaction mixture was stirred at room temperature for 3 hours. TLC (methanol-chloroform 1:12) indicated that the starting material (Rf = 0.09) was converted to 6-O-silylated product (Rf = 0.35). The reaction mixture was then concentrated under reduced pressure and coevaporated with toluene. The residue was purified by radial silica gel chromatography on Chromatotron (2 mm plate) using 6% methanol-methylene chloride as eluent to give compound 53 (629 mg) in 87% yield: [α]<sub>D</sub> -24.3° (c = 0.5, CHCl<sub>3</sub>); CI-MS (ether) gave m/z (ion, relative intensity): 387.0 ([M]+, 75.0%); 277.0 ([M-PhSH]+, 100%); IR (thin film, ν<sub>cm-1</sub>) 3394 (br), 2930, 2856, 1608, 1472, 1454, 1081, 841, 743, 693; <sup>1</sup>H-NMR(CDCl<sub>3</sub>) δ (ppm): 7.55-7.23 (m, 5H, Ph), 4.49 (d, 1H, J<sub>1,2</sub> = 8.2 Hz, H-1), 4.07-3.48 (m, 6H, H-2, 3, 4, 5, 6a, 6b), 3.05 (br, 3H, OH), 0.88 (s, 9H, SiMe<sub>3</sub>), 0.08, 0.06 (s, 6H, SiCH<sub>3</sub>); <sup>13</sup>C-NMR (CDCl<sub>3</sub>) δ (ppm): 147.6-125.8 (6C, aromatic), 88.8 (C-1), 78.7 (C-5), 69.8 (C-3), 69.7 (C-4), 69.5 (C-2), 63.1 (C-6), 25.9 (3C, SiMe<sub>3</sub>), 18.2 (C(CH<sub>3</sub>)<sub>3</sub>), -5.3, -5.4 [2C, SiMe<sub>3</sub>].

**Para-Nitrophenyl 6-O-t-butyldimethylsilyl-1-thio-β-D-galactopyranoside 54**

To a solution of para-nitrophenyl 1-thio-β-D-galactopyranoside 47 (2.0 g, 6.30 mmol) in dry pyridine (60 mL) was added t-butyldimethylsilyl chloride (1.07 g, 7.10 mmol) at 0 °C. The reaction mixture was stirred at room temperature for 3.5 hours. TLC (methanol-chloroform 1:10) indicated that the starting material (Rf = 0.11) was converted to 6-O-silylated product 54 (Rf = 0.40). The reaction mixture was concentrated under
reduced pressure and co-evaporated with toluene to give crude 54 which was purified by radical chromatography on silica gel with ethyl acetate-hexane (2:1, v/v) as eluent to give pure 54 (2.42 g) in 89% yield: m.p. 161.7-162.9 °C; [α]D -91.3° (c = 0.9, CH3OH); IR (KBr, νcm⁻¹): 3509, 2928, 1578, 1516, 1473, 1340, 1252, 1090, 855, 740; Cl-MS (ether) gave m/z (ion, relative intensity): 431.9 ([M]+, 66.3%), 277.0 ([M-HSPhNO2]+, 95.5%); 

¹H-NMR (CHCl₃) δ (ppm): 8.12 (d, J₆₋₇ = 9.0 Hz, H-meta), 7.61 (d, H-ortho), 4.67 (d, 1H, J1,2 = 9.7 Hz, H-1), 4.06 (d, 1H, J₃₋₄ = 2.5, J₄₋₅ < 1.0 Hz, H-4), 3.95-3.56 (m, 5H, H-2, H-3, H-5, H-6a, H-6b), 0.88 (s, 9H, SiCMe₃), 0.07, 0.06 (s, 6H, SiCH₃).

**Phenyl 2,3,4-tri-O-benzoyl-6-O-t-butyldimethylsilyl-1-thio-β-D-galactopyranoside 57**

To a solution of phenyl 6-O-t-butyldimethylsilyl-1-thio-β-D-galactopyranoside 53 (600 mg, 1.56 mmol) in dry pyridine (5 mL) was added benzoyl chloride (667 μL, 5.69 mmol) at 0 °C. The reaction mixture was stirred at room temperature for 3.5 hours. The reaction mixture was then poured onto ice and extracted with chloroform. The extracts were collected and washed with saturated sodium bicarbonate and brine. The solution was dried over sodium sulfate and evaporated to dryness under reduced pressure. The residue was purified by radial chromatography on Chromatotron (2 mm plate) using ethyl acetate-hexane (1:3 v/v) as eluent to give 2,3,4-tri-O-benzoylated product 57 (925 mg) in 85% yield and 2,3-di-O-benzoylated byproduct 58 (47 mg) in 5% yield. Compound 57 could be crystallized from ethanol: m.p. 86.3-88.2 °C; [α]D +103° (c = 1.0, CHCl₃); IR (neat, νcm⁻¹): 3065, 2941, 2857, 1729, 1602, 1452, 1316, 1269, 1102, 842, 709; M.S.(C.I. ether) (M/Z): 699.2 ([M]+, 5.3%), 588.9 ([M-HSPh]+, 100%); 

¹H-NMR (CDCl₃) δ (ppm): 7.97-7.16 (m 20H, aromatic), 5.94 (dd, 1H, J₄₋₅ = 0.8 Hz, H-4), 5.69 (dd, 1H, J₂₋₃ = 9.9 Hz, H-2), 5.56 (dd, 1H, J₃₋₄ = 3.1 Hz, H-3), 4.98 (d, 1H, J₁₋₂ = 9.5 Hz, H-1), 4.06 (ddd, 1H, J₅₋₆ = 6.0, J₅₋₇ = 7.4 Hz, H-5), 3.86 (dd, 1H, J₆₋₇ = 10.3 Hz, H-6a), 3.77 (dd, 1H, H-6b), 0.83 (s, 9H, t-Butyl), -0.02, -0.07 (2s, 2xSiMe); 

¹³C-NMR (CDCl₃) δ (ppm): 165.5, 165.2, 165.1 (3xC=O, Bz), 133.9-128.2 (24C, aromatic), 85.8 (C-1), 78.0 (C-5), 73.4 (C-3), 115
68.2 (C-2), 68.1 (C-4), 61.1 (C-6), 25.8 (3C, SiCMes), 18.2 (CMes), -5.5, -5.6 [2C, Si(Me)2].

Anal. Calcd for C_{39}H_{41}O_{10}NSSi (698.88): C, 67.02; H, 6.06; S, 4.59. Found: C, 66.78; H, 6.11; S, 4.61.

Phenyl 2,3-di-O-benzoyl-6-O-t-butyldimethylsilyl-1-thio-β-D-galactopyranoside 58

Compound 58 had: m.p. 60.9-63.2 °C; [α]$_D$ +80° (c = 1.1, CHCl$_3$); CI-MS (ether) gave m/z (ion, relative intensity): 594.9 ([M]$^+$, 4.4%), 484.9 ([M-3H$_2$Ph]$^+$, 96.4%); IR (neat, ν$_{cm^{-1}}$): 3478, 3065, 2941, 2857, 1720, 1602, 1460, 1273, 1100, 842, 710; 1H-NMR (CDCl$_3$ $\delta$ (ppm): 7.98-7.18 (m, 15H, aromatic), 5.86 (dd, 1H, J$_{2,3}$ = 9.9 Hz, H-2), 5.36 (dd, 1H, J$_{3,4}$ = 2.8 Hz, H-3), 4.99 (d, 1H, J$_{1,2}$ = 9.9 Hz, H-1), 4.66 (dd, 1H, J$_{4,5}$ = 0.9 Hz, H-4), 4.06-3.95 (m, 2H, H-5, H-6a), 3.78 (dd, 1H, H-6b), 3.45 (br, 1H, OH), 0.92 (s, 9H, t-Butyl), 0.12, 0.11 (2s, 2xSiMe); 13C-NMR (CDCl$_3$ $\delta$ (ppm): 165.9, 165.26 (2xC=O, Bz), 133.3-127.9 (18C, aromatic), 86.7 (C-1), 78.0 (C-5), 75.9 (C-3), 68.4, 68.1 (C-2, C-4), 63.5 (C-6), 25.9 (3C, SiCMes), 18.3 (CMes), -5.4 [2C, Si(Me)$_2$].

Anal. Calcd for C$_{39}$H$_{41}$O$_{10}$NSSi (594.77): C, 64.62; H, 6.44; S, 5.39. Found: C, 64.51; H, 6.54; S, 4.98.

Para-nitrophényl 2,3,4-tri-O-benzoyl-6-O-t-butyldimethylsilyl-1-thio-β-D-galactopyranoside 59

To a solution of 6-O-t-butyldimethylsilyl-β-D-galactopyranoside 54 (2.72 g, 6.3 mmol) in dry pyridine (60 mL) was added benzoyl chloride (2.7 mL) at 0 °C. The reaction mixture was stirred at room temperature under nitrogen for 5 hours. TLC (Ethyl Acetate-Hexane 3:5) indicated that the reaction was complete. The mixture was then poured onto ice and extracted with chloroform (50 mL x 3). The extracts were collected and washed with saturated sodium bicarbonate, saturated sodium chloride and water. The organic phase was dried (Na$_2$SO$_4$) filtered and evaporated under reduced pressure. The residue was crystallized from ethanol to afford 59 (4.03 g) in 86% yield: m.p. 159.2-160.5 °C; [α]$_D$ +84.4° (c = 1.0, CHCl$_3$); CI-MS (ether) gave m/z (ion, relative intensity): 474 (
[M+1]⁺, 7.1%), 589 ([M+1-SPhNO₂]⁺, 49.0%), 298 ([M-SPh-2(AcOH)]⁺, 100%). 240 ([M-SPh-AcOH-2(AcO)]⁺, 62.1%); ¹H-NMR (CDCl₃) δ (ppm): 8.20-7.18 (m 19H, Aromatic), 5.98 (dd, 1H, J₄,5 = 0.9 Hz, H-4), 5.76 (dd, 1H, J₂,3 = 9.9 Hz, H-2), 5.63 (dd, 1H, J₃,4 = 3.3 Hz, H-3), 5.23 (d, 1H, J₁,₂ = 9.8 Hz, H-1), 4.12 (ddd, 1H, J₅,₆₅ = 6.8, J₅,₆₆ = 6.2 Hz, H-5), 3.88 (dd, 1H, J₆₅,₆₆ = 10.2 Hz, H-6a), 3.77 (dd, 1H, H-6b), 0.84 (s, 9H, t-Butyl), -0.01, -0.05 (2s, 2xSiMe); ¹³C-NMR (CDCl₃) δ (ppm): 165.4, 165.2, 165.1 (C=O), 141.8-123.8 (C-Aromatic), 84.7 (C-1), 78.5 (C-5), 72.9 (C-3), 67.9 (C-2), 67.8 (C-4), 61.2 (C-6), 25.7 (3c, 3xMe), 18.2 (C(CH₃)₃), -5.5, -5.6 [2C, Si(Me)₂].

Anal. Calcd for (C₉₉H₁₀₉O₁₀NSS): C, 62.96; H, 5.56; N, 1.88; S, 4.31. Found: C, 63.20; H, 5.54; N, 1.91; S, 4.52.

Para-Nitrophenyl 2,3,4-tri-O-benzyl-6-O-trityl-1-thio-β-D-galactopyranoside 61

Trityl chloride (1.05 g, 3.78 mmol) was added to a solution of p-nitrophenyl-1-thio-β-D-galactopyranoside 47 (1 g, 3.15 mmol) in pyridine (15 mL). The mixture was stirred at room temperature overnight. TLC (MeOH/CHCl₃, 1:10) showed clear and complete conversion of starting material (Rf = 0.05) to intermediate 6-O-trityl-1-thio-β-D-galactopyranoside (Rf = 0.39). The solution was concentrated under reduced pressure. Sodium hydride (50% in oil, 680 mg, 14.18 mmol) was slowly added to a solution of the residue and benzyl bromide (1.69 mL, 14.18 mmol) in dry N,N-dimethyl formamide (18 mL) at 0 °C. The mixture was allowed to attain room temperature, and after 15 hours methanol (5 mL) was added to destroy excess benzyl bromide. After 45 min the solution was neutralized with acetic acid, diluted with dichloromethane (60 mL), washed with water (2×50 mL), dried, and concentrated. Column chromatography of the residue on silica gel (ethyl acetate-hexane 1:5) gave 61 (2.24 g) in 86% yield: m.p. 136.4-137.3 °C; [α]D +3.5° (c = 0.97, CHCl₃); M.S. (Pos FAB) (relative intensity) M/Z: 830.27 ([M+1]⁺, 2%), 570.18 ([M-PphCOH]⁺ 12%); L.R.(thin film, νcm⁻¹): 3050, 2890, 1585, 1514, 1451, 1339, 1085, 852, 763, 700; ¹H-NMR (CDCl₃) δ (ppm): 7.83-7.80 (m, 2xH, Ph-meta, J₉₉ = 9.0 Hz), 7.56-7.53 (m, 2H, Ph-ortho, J₉₉ = 9.0 Hz), 7.39-7.10 (m, 30 H, aromatic), 4.84 (AB pattern, Jab =11.0 Hz, H-a), 4.73-4.62 (m, 4H, 2xPhCH₂), 4.65 (d, 1H, J₁,₂ = 9.5 Hz,
H-1), 4.50 (AB pattern, J = 11.0 Hz, H-b), 3.96 (dd, 1H, J_{1,2} = 9.5, J_{2,3} = 9.5 Hz, H-2),
3.89 (d, 1H, J_{3,4} = 2.6, J_{4,5} < 1.0 Hz, H-4), 3.56 (dd, 1H, J_{3,4} = 2.6 Hz, H-3), 3.53-3.20 (m,
3H, H-5, H-6a, H-6b); $^{13}$C-NMR (CDCl$_3$) $\delta$ (ppm): 145.7-123.7 (42C, C-aromatic), 85.5
(C-1), 83.9 (C-3), 77.8 (C-5), 76.6 (C-2), 75.7 (PhCH$_2$), 74.4 (PhCH$_2$), 73.5 (C-4), 72.8
(PhCH$_2$), 62.8 (C-6).

Para-Nitropheny1 2,3,4-tri-O-acetyl-6-O-p-toluenesulfonyl-1-thio-\(\beta\)-D-
galactopyranoside 62

To a solution of 4-nitropheny1 1-thio-\(\beta\)-D-galactopyranoside 47 (0.4 g, 1.26
mmol) dissolved in dry pyridine (15 mL) was added p-toluenesulfonyl chloride (0.34g,
1.76 mmol). After the reaction mixture was stirred at room temperature for 2.5 hours.,
TLC (5% methanol in methylene chloride) showed complete conversion of the starting
material (Rf = 0.18) to 6-tosylated derivative (Rf = 0.48). To this reaction mixture was
added acetic anhydride (3 mL), stirring was continued for additional 4 hours. The solvent
was evaporated under reduced pressure and the residue was purified by radial
chromatography on silica gel Chromatotron (2 mm plate) using ethyl acetate-hexane (2:5,
v/v) as eluent to provide 62 (512 mg) in 68% yield: m.p. 93.7-95.4 °C; [\(\alpha\)]$_D$ -23.5° (c =
1.0, CHCl$_3$); (+)-FAB-MS (glycerol) gave m/z (ion, relative intensity): 597.1 ([M+1]$^+$,
1.6%), 443.1 ([M-SPhNO$_2$]$^+$, 99.4%); $^1$H-NMR (CDCl$_3$) $\delta$ (ppm): 8.09 (d, $J_{ax}$ = 9.0 Hz,
2H, H-meta of SPhNO$_2$), 7.74 (d, $J_{ax} = 8.2$ Hz, 2H, H-meta of tosyl), 7.54 (d, 2H, H-
ortho of SPhNO$_2$), 7.32 (d, 2H, H-ortho of tosyl), 5.43 (dd, 1H, $J_{ax} = 1.0$ Hz, H-4), 5.24
(dd, 1H, $J_{2,3} = 9.9$ Hz, H-2), 5.06 (dd, 1H, $J_{3,4} = 3.3$ Hz, H-3), 4.84 (d, 1H, $J_{1,2} = 9.9$ Hz,

General Procedure for the Selective De-O-silylation of Monosaccharides

Acetyl chloride (1 mL) was added dropwise to methanol (20 mL) and the hydrogen chloride solution obtained was cooled to 20 °C. A solution of the silyl derivatives 57, 59, 60 (1 mmol) in ethyl ether (20 mL) was added. The reaction mixture was stirred at room temperature for 30 min (TLC solvent EtOAc/hexane 2:5, v/v). The reaction mixture was neutralized with Amberlite IR-45 (OH⁻), concentrated and the crude residue was purified by silica gel column chromatography using ethyl acetate-hexane (1:5, v/v) as an eluent. Thus, compounds 63-65 were obtained.

Phenyl 2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 63

Compound 63 (567 mg) was obtained in 97% yield: [α]D +123.2° (c = 1.0, CHCl₃); CI-MS (ether) gave m/z (ion, relative intensity): 584.8 (M⁺, 1.5%), 474.8 ([M-HSPh⁺], 13.5%); ¹H-NMR (CDCl₃) δ (ppm): 7.99-7.09 (m 20H, 4 Ph), 5.80 (d, 1H, J₄,₅ < 1.0 Hz, H-4), 5.77 (dd, 1H, J₂,₃ = 9.9 Hz, H-2), 5.56 (dd, 1H, J₃,₄ = 3.2 Hz, H-3), 5.00 (d, 1H, J₁,₄ = 9.9 Hz, H-1), 4.07 (ddd, 1H, H₅,₆a = 6.6, H₅,₆b = 6.5 Hz, H-5), 3.88 (dd, 1H, J₆a,₆b = 11.9 Hz, H-6a), 3.65 (dd, 1H, H-6b), 2.50 (br, 1H, 6-OH); ¹³C-NMR (CDCl₃) δ (ppm): 166.4, 165.5, 165.2 (C=O, Bz), 134.1-128.3 (C-aromatic), 85.5 (C-1), 77.9 (C-5), 73.2 (C-3), 68.9 (C-2), 68.0 (C-4), 60.8 (C-6).

Para-Nitrophenyl 2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 64

Compound 64 (2.82 g) was obtained in 91% yield: m.p. 106.5-107.7 °C; [α]D +69.9° (c = 1.0, CHCl₃); CI-MS (ether) gave m/z (ion, relative intensity): 630 (M⁺, 8.5%), 612 ([M-H₂O⁺], 4.1%), 504 ([M-PhCO₂H]⁺, 4.8%), 475 ([M-HSPhNO₂]⁺, 100%), 353 ([M-PhCO₂H-HSPhNO₂]⁺, 27.4%), 233 ([M-HSPhNO₂-2xPhCO₂⁻]⁺, 100%), 215 ([M-HSPhNO₂-2xPhCO₂⁻-H₂O⁺], 24.6%); ¹H-NMR (CDCl₃) δ (ppm): 8.17-7.18 (m 19H, aromatic), 5.87 (d, 1H, J₄,₅ < 1.0 Hz, H-4), 5.86 (dd, 1H, J₂,₃ = 9.9 Hz, H-2), 5.64 (dd,
Para-Nitrophenyl 2,3,4-tri-O-pivaloyl-1-thio-β-D-galactopyranoside 65

Compound 65 (337 mg) was obtained in 98% yield: [α]D -11.6° (c = 1.0, CHCl₃); CI-MS (ether) gave m/z (ion, relative intensity): 569.7 ([M]+, 1.1%), 414.9 ([M-HSPhNO₂]+, 100%); 1H-NMR (CDCl₃) δ (ppm): 8.12 (d, J₄,6 = 9.0 Hz, H-meta), 7.61 (d, H-ortho), 5.38 (d, 1H, J₄,5 < 1.0 Hz, H-4), 5.29 (dd, 1H, J₂,3 = 9.9 Hz, H-2), 5.15 (dd, 1H, J₃,4 = 3.0 Hz, H-3), 4.83 (d, 1H, J₁,2 = 9.6 Hz, H-1), 3.90 (dd, 1H, H₅,₆ = 6.8 Hz, H-5), 3.71 (dd, 1H, J₆,₇ = 11.7 Hz, H-6a), 3.45 (dd, J₅,₆ = 6.2 Hz, H-6b), 2.15 (br, 1H, OH), 1.18, 1.16, 1.07 (3s, 27 H, 3xtBu, Piv.); 13C-NMR (CDCl₃) δ (ppm): 177.7, 177.2, 176.5 (C-O, Piv), 146.9 (C-para), 141.3 (C-ips), 131.6 (C-meta), 123.7 (C-ortho), 84.2 (C-1), 78.1 (C-5), 72.0 (C-3), 67.5 (C-2), 66.3 (C-4), 60.6 (C-6), 39.0, 38.7 (2C), (3xC(O)C(CH₃)₃), 27.0 (9C, 3xtBu, Piv).

Para-Nitrophenyl 2,3,4-tri-O-benzyl-1-thio-β-D-galactopyranoside 66

To a solution of 4-nitrophenyl 2,3,4-tri-O-benzyl-6-O-trityl-1-thio-β-D-galactopyranoside 61 (2.0 g, 2.41 mmol) in MeOH/CH₂Cl₂ (30 mL, 1:1 v/v) was added p-toluenesulfonic acid (20 mg, 0.12 mmol). The mixture was stirred at room temperature for 30 min. TLC (ethyl acetate/hexane 3:7) indicated complete conversion of the starting material (Rf = 0.52) to product (Rf = 0.15). Triethyl amine (1 mL) was added the reaction mixture which was stirred for additional 15 min. The reaction mixture was evaporated under reduced pressure and coevaporated with toluene (10 mL x2). The residue was then purified by column chromatography using ethyl acetate-hexane (2:7 in v/v) as eluent. Compound 66 (1.34 g) was obtained in 95% yield: m.p. 129.4-130.3 °C; [α]D -29.5° (C = 0.78, CHCl₃); CI-MS (ether) gave m/z (ion, relative intensity): 570.3 ([M-H₂O]+, 1.1%), 433.2 ([M-HSPhNO₂]+, 15.2%), 325 ([M-HSPhNO₂-BnOH]+, 13.1%), 219 ([M-
HSPhNO₂-OCH₂CH₂OJ, 32.8%); I.R.(thin film, νₐ₅₃₄): 3448 (br), 3031, 2890, 1585, 1513, 1453, 1340, 1083, 852, 739, 698; ¹H-NMR (CDCl₃) δ (ppm): 7.96-7.91 (m, 2H, J₉,₉ = 9.0 Hz Ph-meta, ), 7.60-7.55 (m, 2H, J₉,₉ = 9.0 Hz Ph-ortho), 7.41-7.23 (m, 15H, aromatic), 5.00 (AB pattern, J₉,₉ = 11.2 Hz, H-a), 4.77-4.68 (m, 4H, 2xPhCH₂), 4.72 (d, 1H, J₁,₂ = 8.9 Hz, H-1), 4.61 (AB pattern, J₉,₉ = 11.2 Hz, H-b), 4.01 (dd, 1H, J₃,₃ = 9.5 Hz, H-2), 3.91 (d 1H, J₄,₄ < 1.0 Hz, H-4), 3.63 (dd, 1H, J₃,₄ = 2.6 Hz, H-3), 3.88-3.51 (m, 3H, H-5, H-6a, H-6b), 1.59 (br, 1H, OH); ¹³C-NMR (CDCl₃) δ (ppm): 145.9-123.9 (24C, C-aromatic), 85.6 (C-1), 84.1 (C-3), 79.1 (C-5), 76.7 (C-2), 75.8 (PhCH₂), 74.5 (PhCH₂), 73.12 (C-4), 72.9 (PhCH₂), 62.1(C-6).

Anal. Calcld for (C₃₅H₄₃O₇NS): C, 67.44; H, 5.66; N, 2.38; S, 5.46. found: C, 67.18; H, 5.79; N, 2.35; S, 5.61.

**Para-Nitrophenyl 3,4-O-isopropylidene-1-thio-β-D-galactopyranoside 67**

To a solution of para-nitrophenyl 1-thio-β-D-galactopyranoside 47 (2.0 g, 6.3 mmol.) in 2,2-dimethoxypropane (50 mL) was added p-toluenesulfonic acid (61 mg, 0.325 mmol). The mixture was stirred for 2.5 hours at room temperature under nitrogen, triethylamine (0.45 mL, 3.25 mmol) was then added. After stirring for 15 min, TLC showed that one major (Rf = 0.68) and two minor products (Rf = 0.84, Rf = 0.33) were produced. The reaction mixture was concentrated under reduced pressure. The residue in 10:1 MeOH-water (50 mL) was boiled under reflux until TLC (EtOAc, 100%) showed the complete disappearance of the fast-moving product (Rf = 0.82) (4.5 hours). The mixture was concentrated. The product mixture was separated by silica gel column chromatography using EtOAc/Hexane (3:5 v/v) as eluent to afford 67a (2.25 g) in 81% yield and 67b (240 mg) in 11% yield.

Compound 67a had: m.p. 127-128 °C; [α]D -62.1° (c = 1.0, CHCl₃); CI-MS (ether) gave m/z (ion, relative intensity): 358.0 ([M+1]⁺, 7.9%), 202.9 ([M+1-SPhNO₂]⁺, 100%); IR (KBr, νcm⁻¹): 3400 (br), 3104, 2989, 2936, 1726, 1587, 1517, 1479, 1356, 1231, 1070, 965, 849, 739; ¹H-NMR (CDCl₃) δ (ppm): 8.15 (d, 2H, J₉,₉ = 9.0 Hz, H-meta), 7.58 (d, 2H, H-ortho), 4.68 (d, 1H, J₁,₂ = 10.1 Hz, H-1), 4.24 (dd, 1H, J₄,₄ = 1.9
Hz, H-4), 4.14 (dd, 1H, J_{3,4} = 5.8 Hz, H-3), 4.00-3.95 (m, 2H, H-5, H-6a), 3.84 (m, 1H, H-6b), 3.70 (dd, 1H, J_{2,OH} = 2.9, J_{2,3} = 6.8 Hz, H-2), 2.53 (d, 1H, J_{2,OH} = 3.0 Hz, 2-OH), 2.12 (dd, 1H, 6-OH), 1.47 and 1.35 (2s, 6H, Me₂C); \textsuperscript{13}C-NMR (CDCl₃) δ (ppm): 146.4 (C-para), 143.0 (C-ipso), 129.6 (C-meta), 124.0 (C-ortho), 110.7 (CMe₂), 86.0 (C-1), 79.2 (C-3), 77.1 (C-5), 73.7 (C-4), 71.5 (C-2), 62.4 (C-6), 28.0 and 26.1 (CMe₂).

Anal. Calcd for (C₁₅H₁₉O₇NS): C, 50.41; H, 5.36; N, 3.92; S, 8.97. Found: C, 50.03; H, 5.32; N, 3.78; S, 8.68.

Compound 67b had: \textsuperscript{1}H-NMR (CDCl₃) δ (ppm): 8.11 (d, J_{meta} = 9.0 Hz, H-meta), 7.55 (d, H-ortho), 4.60 (d, 1H, J_{1,2} = 9.5 Hz, H-1), 4.22 (dd, 1H, J_{4,5} = 1.1 Hz, H-4), 4.10-3.92 (AB system, 2H, H-6a, H-6b), 3.78 (dd, 1H, J_{2,3} = 9.1 Hz, H-2), 3.60 (dd, 1H, J_{3,4} = 5.8 Hz, H-3), 3.48 (m, 1H, H-5), 1.45 and 1.34 (2s, 6H, Me₂C).

Para-Nitrophenyl 2,6-di-O-benzoyl-3,4-O-isopropylidene-1-thio-β-D-galactopyranoside 68

Para-Nitrophenyl 3,4-O-isopropylidene-1-thio-β-D-galactopyranoside 67 (2.4 g, 6.72 mmol) in dry pyridine (15 mL) was cooled 0 °C and benzoyl chloride (4.7 mL, 40.32 mmol) was added in one portion. The mixture was allowed to reach room temperature. The stirring was continued overnight. TLC (Toluene-Ethyl Acetate 2:1) indicated that the starting material (Rf = 0.21) was completely converted to product (Rf = 0.57). The mixture was then poured onto ice water, extracted with methylene chloride (2×25 mL). The extracts were collected and washed with saturated NaHCO₃, saturated NaCl solution and dried (Na₂SO₄), filtered and evaporated under reduced pressure. The residue was recrystallised form ether-hexane (1:3, v/v) to afford the first portion of the product 68 (3.05 g) as a crystalline compound. The mother solution was concentrated and chromatographed on silica gel (eluent: ethyl acetate-hexane, 1:2, v/v) to afford the second portion of the product 68 (0.38 g). The total yield of 68 was 3.43 g (90%): m.p. 204-205 °C; [α]D -11.5° (c = 1.0, CHCl₃), [α]Hg\textsuperscript{436} -94.0° (C =1.0, CHCl₃); IR (KBr, ν\textsubscript{cm-1}): 2992, 1721, 1596, 1515, 1450, 1381, 1341, 1266, 1093, 1036, 876, 844, 707; \textsuperscript{1}H-NMR (CDCl₃) δ (ppm): 8.06-7.39 (m, 14H, aromatic), 5.38 (dd, 1H, J_{2,3} = 9.6 Hz, H-2), 4.96 (d, 1H, J_{1,2}}

Anal. Calcd for (C₂₉H₂₇O₉NS): C, 61.59; H, 4.81; N, 2.48; S, 5.67. Found: C, 61.90; H, 4.97; N, 2.52; S, 5.76.

**Para-Nitrophenyl 6-O-benzoyl-3,4-O-isopropylidene-1-thio-β-D-galactopyranoside**

**Para-Nitrophenyl 3,4-O-isopropylidene-1-thio-β-D-galactopyranoside** 67 (0.8 g, 2.23 mmol) in dry pyridine (2 mL) and methylene chloride (5 mL) was cooled to -70 °C and benzoyl chloride (0.31 mL) in methylene chloride (4 mL) was added slowly. The mixture was stirred at -70 °C for 30 min. The mixture was then poured onto ice, extracted with methylene chloride (2x10 mL). The extracts were collected and washed with saturated NaHCO₃, saturated NaCl solution and dried (Na₂SO₄), filtered and evaporated under reduced pressure. The residue was chromatographed on silica gel (ethyl acetate-hexane, 3:7) to afford 6-O-benzoylated product 69 (642 mg) in 63% yield: m.p. 98-99 °C, [\(\alpha\rime\)]D -107° (c = 1.0, CHCl₃); CI-MS (ether) gave m/z (ion, relative intensity): 461.9 ([M]+, 3.9%), 306.9 ([M-HSPhNO₂]+, 100%); IR (KBr, \(\nu\ rime\ rime\) cm⁻¹): 3434, 2989, 2930, 1719, 1586, 1514, 1479, 1380, 1340, 1270, 1220, 1190, 1030, 873, 852, 750, 713; \(^{1}\)H-NMR (CDCl₃) δ (ppm): 8.05-7.42 (m 9H, aromatic), 4.70 (dd, 1H, J_{5,6a} = 3.6, J_{6a,6b} = 12.0 Hz, H-6a), 4.68 (d, 1H, J_{1,2} = 10.0 Hz, H-1), 4.58 (dd, 1H, J_{5,6b} = 8.4 Hz, H-6b), 4.31 (dd, 1H, J_{3,4} = 5.6, J_{4,5} = 2.2 Hz, H-4), 4.27-4.12 (m, 2H, H-3, H-5), 3.76 (m, 1H, H-2), 2.60 (d, 1H, J = 2.8 Hz, OH), 1.52, 1.37 (2s, 6H, CMe₂); \(^{13}\)C-NMR (CDCl₃) δ (ppm): 167.0 (C=O, Bz), 147.1 (C-para), 143.9 (C-ipso), 134.4-124.6 (10C, aromatic), 111.7 (CMe₂), 86.8 (C-1), 80.0 (C-3), 75.4 (C-5), 74.1 (C-4), 72.6 (C-2), 64.7 (C-6), 28.8 and 26.97 (CMe₂).

Anal. Calcd for (C₂₂H₂₂O₈NS): C, 57.26; H, 5.02; N, 3.04; S, 6.95. Found: C, 57.06; H, 4.83; N, 2.87; S, 6.77.
Para-Nitrophenyl 2,6-di-O-benzoyl-1-thio-β-D-galactopyranoside 70

Compound 68 (3 g, 5.32 mmol) was suspended in methanol (100 mL) and a catalytic amount of p-TsOH (0.5 g) was added. The reaction mixture was stirred at 40 °C overnight, after which time TLC (EtOAc/Hexane 1:1) showed complete conversion of starting material to product. To the reaction mixture was added triethylamine (100 mL). The solution was evaporated under reduced pressure to afford a yellow mass. The crude product was purified with silica gel chromatography using CHCl₃-MeOH (9:1) as eluent to give 70 (2.74 g) in 97% yield: m.p. 182-183 °C; [α]D -44.0° (c = 1.0, DMSO); IR (KBr, ν cm⁻¹): 2992, 1721, 1596, 1515, 1450, 1381, 1341, 1266, 1093, 1036, 876, 844, 707; CI-MS (ether) gave m/z (ion, relative intensity): 526.0 ([M+1]⁺, 0.9%), 507.9 ([M+1-H₂O]⁺, 1.7%), 370.9 ([M+1-HSPHNO₂]⁺, 100%); ¹H-NMR (CDCl₃) δ (ppm): 7.76-7.28 (m 14H, aromatic), 5.21 (dd, 1H, J₂,₂ = 9.5 Hz, H-2), 4.84 (d, 1H, J₁,₂ = 10.1 Hz, H-1), 4.37-3.08 (m, 7H, H-3 - H-6, 2xOH); ¹³C-NMR (DMSO) δ (ppm): 166.6, 166.4 (C=O, Bz), 146.7 (C-para), 145.8 (C-ipso), 134.2-124.5 (16C, aromatic), 84.4 (C-1), 77.8 (C-3), 73.3 (C-5), 71.8 (C-4), 70.2 (C-2), 65.4 (C-6).

Para-Nitrophenyl 6-O-benzoyl-1-thio-β-D-galactopyranoside 71

Para-nitrophenyl 6-O-benzoyl-3,4-O-isopropylidene-1-thio-β-D-galactopyranoside 69 (0.493 g, 1.07 mmol) was suspended in methanol (25 mL) and a catalytic amount of p-TsOH was added. The solution was reflux for 5 hours. To the reaction solution was added triethylamine (1 mL). The solution was evaporated under reduced pressure to afford a yellow mass. The crude product was purified by silica gel chromatography (eluent: CHCl₃:MeOH, 8:1) to provided 71 (440 mg) in 98% yield: m.p. 205-206 °C; [α]D -49.0° (c =1.0, DMSO); IR (KBr, ν cm⁻¹): 3359 (br), 3095, 2919, 2848, 1733, 1585, 1577, 1515, 1451, 1342, 1283, 1133, 1074, 853, 811, 742, 707; (+)FAB-MS (glycerol) gave m/z (ion,
relative intensity): 421.2 ([M]+, 1.2%), 273.1 ([M+HSPnNO2]+, 10%); 1H-NMR (500 MHz, Acetone-d6) δ (ppm): 8.07-7.52 (m, 9H, aromatic), 5.06 (d, 1H, J1,2 = 10.1 Hz, H-1), 4.60 (dd, 1H, J5,6a = 8.3, J6a,6b = 11.6 Hz, H-6a), 4.53 (dd, 1H, J5,6b = 3.7 Hz, H-6b), 4.23 (m, 1H, H-5), 4.11 (d, 1H, J4,5 = 0.9 Hz, H-4), 3.83-3.72 (m, 2H, H-2, H-3); 13C-NMR (DMSO) δ (ppm): 165.5 (C=O, Bz), 146.3 (C-para), 144.6 (C-ipso), 133.5-123.6 (10C, aromatic), 84.9 (C-1), 76.3 (C-3), 74.2 (C-5), 69.0 (C-4), 68.8 (C-2), 64.9 (C-6).

3.5.3 Conversion of Latent Glycosyl Donors to Active Glycosyl Donors by Reduction and Acetylation

Para-Acetamidophenyl 2,3,4,6-tetra-O-acetyl-1-thio-β-D-galactopyranoside 75

Para-Nitrophenyl 2,3,4,6-tetra-O-acetyl-1-thio-β-D-galactopyranoside 9 (250 mg, 0.515 mmol) was dissolved in absolute ethanol (20 mL) to which was added Tin(II) chloride dihydrate (SnCl2·2H2O) (280 mg, 2.57 mmol). The reaction mixture was stirred at 70 °C for 2 hours. TLC (2% ethanol in dichloromethane) indicated clear transformation of nitro compound 9 (Rf = 0.34) into amino intermediate (Rf = 0.28, ninhydrin positive). The reaction mixture was then cooled and poured onto ice-water and the final pH of the solution adjusted to 7-8 with NaHCO3. The resulting mixture was extracted with EtOAc (40x3 mL) which was successively washed with sat. NaHCO3 and water. The organic phase was dried (Na2SO4) and concentrated under reduced pressure. The resulting crude 4-aminophenyl thioglycoside was immediately treated with pyridine (4 mL) and acetic anhydride (2 mL) at room temperature overnight. The solution was concentrated under reduced pressure and coevaporated with toluene. The residue was purified by silica gel chromatography using EtOAc/Hexane (1:1-3:1, v/v) as eluent to provided 75 (207 mg) in 81% yield: m.p. 135-136 °C; [α]D -6.4° (c = 0.96, CHCl3); CI-MS (ether) gave m/z (ion, relative intensity): 497.8 ([M+H]+, 86.9%), 331.9 ([M+1-SPnNHAc]+, 20.8%); 1H-NMR (CDCl3) δ (ppm): 7.46 (m, 4H, Ph), 7.21 (br, 1H, NH), 5.38 (dd, 1H, J4,5 = 0.8 Hz, H-4),
5.18 (dd, 1H, J_{2,3} = 9.9 Hz, H-2), 5.01 (dd, 1H, J_{1,4} = 3.3 Hz, H-3), 4.61 (d, 1H, J_{1,2} = 9.9 Hz, H-1), 4.16 (dd, 1H, J_{6a,6b} = 11.4 Hz, H-6a), 4.10 (dd, J_{5,6b} = 6.2 Hz, H-6b), 3.87 (ddd, 1H, J_{5,6a} = 7.0 Hz, H-5), 2.13, 2.06, 2.05, 1.96 (s, OAc); ^{13}C-NMR (CDCl_{3}) δ (ppm): 170.3, 170.1, 170.0, 169.4, 168.4 (5xC=O, OAc), 138.3 (C-ipso), 134.1 (C-ortho), 126.7 (C-para), 119.1 (C-meta), 86.7 (C-1), 74.3 (C-5), 71.9 (C-3), 67.2 (C-2), 67.1 (C-4), 61.5 (C-6), 24.5 (NHAc), 20.8, 20.6, 20.6, 20.5 (OAc).

**Para-Aminophenol 2,3,4,6-tetra-O-benzoyl-1-thio-β-D-galactopyranoside 73**

Para-nitrophenol 2,3,4,6-tetra-O-benzoyl-1-thio-β-D-galactopyranoside 50 (300 mg, 0.408 mmol) was suspended in absolute ethanol (20 mL) to which was added Tin(II) chloride dihydrate (SnCl_{2}·2H_{2}O) (460 mg, 2.04 mmol). The reaction mixture was stirred at 70 °C for 2 hours. TLC (ether 100%) indicated that a clear nitro compound (Rf = 0.60) to amino product (Rf = 0.30, ninhydrin positive). The reaction mixture was then cooled and poured onto ice-water and the final pH of the solution adjusted to 7-8 with NaHCO_{3}. The resulting mixture was extracted with EtOAc (20x3 mL) which was successively washed with sat. NaHCO_{3} and water. The organic phase was dried (Na_{2}SO_{4}) and concentrated under reduced pressure. The resulting crude product was purified on silicon gel chromatography with ether-hexane (1:1 in v/v) as eluent to afford pure 73 (239 mg) in 83% yield: m.p. 98-99 °C; [α]_{D} +26° (c = 1.0, CHCl_{3}); IR (thin film, ν_{cm}^{-1}): 3474, 3381, 3066, 2970, 1724, 1622, 1600, 1495, 1451, 1315, 1271, 1098, 909, 826, 712; CI-MS (ether) gave m/z (ion, relative intensity): 704.1 ([M+1]^{+}, 12.3%), 579.2 ([M+1-HSPhNH_{2}]^{+}, 100%); ^{1}H-NMR (CDCl_{3}) δ (ppm): 8.03-7.18 (m, 24H, aromatic), 6.79 (d, 2H, J = 8.3 Hz, NH_{2}), 5.97 (dd, 1H, J_{4,5} < 1.0 Hz, H-4), 5.72 (d, 1H, J_{3,2} = 9.9 Hz, H-2), 5.57 (dd, 1H, J_{5,4} = 3.2 Hz, H-3), 4.89 (d, 1H, J_{1,2} = 9.9 Hz, H-1), 4.63 (m, 1H, H-5), 441-4.34 (m, 2H, H-a, H-6b); ^{13}C-NMR (CDCl_{3}) δ (ppm): 166.0, 165.5, 165.3, 165.1 (C=O, 4xBz), 146.7 (C-para), 137.3 (C-ipso), 133.4 - 115.4 (28C, aromatic), 85.8 (C-1), 74.8 (C-5), 73.1 (C-3), 68.2 (C-4), 67.8 (C-2), 62.3 (C-6).

**Para-Aminophenyl 2,3,4,6-tetra-O-benzyl-1-thio-β-D-galactopyranoside 74**

Para-nitrophenyl 2,3,4,6-tetra-O-benzyl-1-thio-β-D-galactopyranoside 52 (660 mg, 0.97 mmol) was dissolved in absolute ethanol (8 mL) to which was added Tin (II) chloride dihydrate (SnCl<sub>2</sub>2H<sub>2</sub>O) (1.31 g, 5.81 mmol). The reaction mixture was stirred at 70 °C for 2.5 hours. The reaction mixture was then cooled and poured onto ice-water and the final pH of the solution adjusted to pH = 7 with sodium bicarbonate. The resulting mixture was extracted with ethyl acetate (3x20 mL). The extracts were washed successively with sat. sodium bicarbonate and water. The organic phase dried (Na<sub>2</sub>SO<sub>4</sub>)
and concentrated under reduced pressure. The resulting crude 4-aminophenylthio glycoside was purified by column chromatography on silica gel (ether-hexane 2:1) to give pure 74 (500 mg) in 80% yield: [α]D -4.0° (c = 1.0, CHCl3), [α]365(H2O) -11.0° (c = 1.0, CHCl3); IR (KBr, ν cm⁻¹): 3464, 3371, 3062, 3029, 2883, 1261, 1598, 1496, 1454, 1360, 1283, 1094, 825, 739, 698; CI-MS (ether) gave m/z (ion, relative intensity): 647.9 ([M]+, 45.3%), 540.0 ([M-OBn]+, 13.9%); 1H-NMR (CDCl3) δ (ppm): 7.42-7.24 (m, 22H, aromatic), 6.53 (d, 2H, J = 8.5 Hz, NH2), 4.95-4.41 (m, 8H, 4xOCH2), 4.47 (d, 1H, J1,2 = 9.7 Hz, H-1), 3.94 (d 1H, J3,4 = 2.4, J4,5 < 1.0 Hz, H-4), 3.83 (dd, 1H, J2,3 = 9.1 Hz, H-2), 3.63-3.53 (4H, H-3, H-5, H6a, H-6b); 13C-NMR (CDCl3) δ (ppm): 145.8-115.6 (30C, aromatic), 88.7 (C-1), 84.2 (C-5), 77.4 (C-3), 77.1 (C-4), 75.5 (OCH2), 74.3 (OCH2), 73.5 (2C, OCH2, C-2), 72.6 (OCH2), 68.7 (C-6).

Para-Acetamidophenyl 2,3,4,6-tetra-O-benzyl-1-thio-β-D-galactopyranoside 77

Para-aminophenyl 2,3,4,6-tetra-O-benzyl-1-thio-β-D-galactopyranoside 74 (280 mg, 0.40 mmol) was dissolved in pyridine (2.5 mL) and acetic anhydride (5 mL) was added and the solution was stirred for 2 hours at room temperature. TLC (EtOAc-Hexane 2:1) showed a clear conversion of starting material (Rf = 0.52) to product (Rf = 0.23). The solution was evaporated under reduced pressure and coevaporated with toluene (5 mL x 2). The residue was purified by silica gel chromatography (ether, 100%) to afford 77 (294.4 mg) in 91% yield as white solid: m.p. 146-148 °C; [α]D -4.0° (c = 1.0, CHCl3), [α]365(H2O) -19.0° (c = 1.0, CHCl3); IR (KBr, ν cm⁻¹): 3300, 3031, 2881, 1673, 1592, 1527, 1495, 1454, 1396, 1313, 1091, 829, 737, 698; CI-MS (ether) gave m/z (ion, relative intensity): 689.9 ([M]+, 1.8%), 540 ([M-PhNHAc]+, 1.6%); 1H-NMR (CDCl3) δ (ppm): 7.54-7.25 (m, 22H, aromatic), 7.04 (s, 1H, NH), 4.95-4.36 (m, 8H, 4xAB pattern, 4xOCH2), 4.55 (d, 1H, J1,2 = 9.7 Hz, H-1), 3.95 (d, 1H, J3,4 = 2.4, J4,5 < 1.0 Hz, H-4), 3.86 (dd, 1H, J2,3 = 9.4 Hz, H-2), 3.63-3.55 (4H, H-3, H-5, H6a, H-6b), 1.78 (s, 3H, Me); 13C-
NMR (CDCl₃) δ (ppm): 168.1 (C=O, NHAc), 138.7-119.9 (30C, aromatic), 84.5 (C-1), 84.09 (C-5), 77.2 (C-4), 75.6 (C-OCH₃), 74.4 (OCH₃), 73.5 (OCH₃), 73.5 (C-2), 72.6 (OCH₃), 68.7 (C-6), 24.6 (NHAc).

Para-Acetamidophenyl 3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 78

Para-Nitrophenoxy 3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-β-D-glucopyranoside 36 (1 g, 1.75 mmol) was dissolved in absolute ethanol (30 mL) to which was added Tin(II) chloride dihydrate (SnCl₂•2H₂O) (1.84 g, 5.25 mmol). The reaction mixture was stirred at 70 °C for 2.5 hours. TLC (ethyl acetate-hexane 1:1) indicated a clear and complete transformation of nitro compound (Rf = 0.51) to amino intermediate (Rf = 0.18). The reaction mixture was then cooled and poured onto ice-water and the final pH of the solution adjusted to 7-8 with NaHCO₃. The resulting mixture was extracted with ethyl acetate (40x3 mL) which was successively washed with sat. sodium bicarbonate and water. The organic phase was dried (Na₂SO₄) and concentrated under reduced pressure. The resulting crude p-aminophenolhydrochloride was treated with pyridine (4 mL) and acetic anhydride (2 mL) at room temperature overnight. The solution was evaporated under reduced pressure using toluene co-evaporation. The crude residue was purified by silica gel column chromatography using ethyl acetate/hexane (3:5, v/v) as eluent to give 78 (864 mg) in 93% yield: m.p. 184.7-185.6 °C; [α]D +25.1° (c = 1.0, CHCl₃); IR (KBr, νcm⁻¹): 3328, 1748, 1718, 1592, 1525, 1495, 1380, 1234, 1039, 912, 726; (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 532.2 ([M+H]+, 18.4%), 585.2 ([M+1]+, 5.9 %); 418.1 ([M-HSPhNHAc]+, 1.2%); ¹H-NMR (CDCl₃) δ (ppm): 7.86-7.72 (m, 4H, Phth), 7.41-7.30 (m, 4H, SPhNHAc), 5.74 (dd, 1H, J₃,4 = 9.2 Hz, H-3), 5.59 (d, 1H, J₁₂ = 10.5 Hz, H-1), 5.08 (dd, 1H, J₄,₅ = 10.1 Hz, H-4), 4.26 (dd, 1H, J₂₃ =10.3 Hz, H-2), 4.25-4.12 (m, 2H, H-6a, H-6b), 3.84 (ddd, 1H, J₄,₅ = 10.2 J₅,₆ = 2.6, J₅,₆ = 5.0 Hz, H-5), 2.15, 2.08, 1.99, 1.80 (4s, OAc, NHAc), 1.62 (br, 1H, NH); ¹³C-NMR (CDCl₃) δ (ppm): 170.7,
176.1, 169.4, 168.5 (C=O, OAc, NHAc), 167.8, 167.0 (C=O, Phth), 138.7-119.9 (12C, aromatic), 83.1 (C-1), 75.9 (C-5), 71.6 (C-3), 68.6 (C-4), 62.1 (C-6), 53.5 (C-2), 24.6, 20.8, 20.6, 20.4 (OAc, NHAc).

Para-N-Acetimidophenyl (Methyl 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosid) onate 79

To a solution of methyl (para-nitrophenyl) 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosid) onate (800 mg, 1.27 mmol) in absolute ethanol (40 mL) was added Tin (II) chloride dihydrate (SnCl_{2}·H_{2}O) (1.44 g, 6.37 mmol). The reaction mixture was stirred at 70 °C for 3 hours. TLC (4% ethanol in dichloromethane) indicated the transformation to be completed. The reaction mixture was then cooled and poured onto ice-water and the final pH was adjust to 7-8 with NaHCO_{3}. The resulting mixture was extracted with EtOAc (120 mL) which was successively washed with saturated NaHCO_{3} and water. The organic phase was dried over MgSO_{4} and evaporated under reduced pressure. The resulting crude p-aminophenylthio glycoside was immediately treated overnight with pyridine (8 mL) and acetic anhydride (4 mL) at room temperature. The solution was thoroughly evaporated under reduced pressure using toluene evaporation. The crude residue was purified by silica gel chromatography using 3% methanol in dichloromethane as eluent. After pooling and evaporating the desired fractions, compound 79 (705 mg) was obtained in 87% overall yield: m.p. 97-99 °C; (EtOAc); [α]_{D}^{28} +33.9° (c = 1.86, CHCl_{3}; I.R.(thin film, ν_{max}): 3302, 3099, 3016, 1742, 1668, 1591, 1529, 1494, 1437, 1371, 1233, 1129, 1041, 954, 835, 756; CI-MS (ether) gave m/z (ion, relative intensity): 641 ([M]^{+}, 87.5%), 581 ([M-AcOH]^{+}, 100%), 521 ([M-2xAcOH]^{+}, 3.1%), 476 ([M-HPPhNHAc]^{+}, 56.2%); ^{1}H-NMR (CDCl_{3}) δ (ppm): 7.81(s, br, 1H, NH), 7.49 (d, 2H, J_{HH} = 8.7 Hz, H-ortho), 7.39 (d, 2H, H-meta), 5.43 (d, 1H, J_{NN} = 9.3, NH), 5.27 (dd, 1H, J_{J,4} = 7.2 Hz, H-7), 5.22 (dd, 1H, J_{8,9a} = 2.5 Hz, H-8), 4.81 (ddd, 1H, J_{4,5} = 10.2 Hz, H-4), 4.36 (dd, 1H, J_{9a,9b} = 12.5, H-9a), 4.16 (dd, 1H, J_{8,9b} = 5.3

3.6.4 Application of “Active-Latent” Glycosylation Methodology in the Synthesis of (1→6) and (1→3) Linked Oligosaccharides

O-(3,4,6-tri-O-Acetyl-2-deoxy-2-phthalimido-β-D-glucopyranosyl)-(1→6)-1,2:3,4-di-O-isopropylidene-α-D-galactopyranose 81

Method A: Ethyl 3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 32 (132 mg, 0.28 mmol) and 1,2:3,4-di-O-isopropylidene α-D-galactopyranose 80 (60 mg, 0.23 mmol) were dissolved in dry CH2Cl2 (2 mL) under nitrogen. Pulverized molecular sieves (4 Å, 150 mg) was added and the solution was stirred under nitrogen for 1 hour. Then the reaction mixture was cooled -30 ºC and N-iodosuccinimide (128 mg, 0.46 mmol) and trifluoromethanesulfonic acid (4 µL) were then added. The reaction was essentially complete (as judged by TLC) after 15 min. The mixture was then diluted with dichloromethane (10 mL) and filtered through celite. The filtrate was washed with 10% aqueous sodium thiosulfate (10 mL), saturated aqueous sodium bicarbonate (2x10 mL) and brine (10 mL). The solution was dried (Na2SO4) and concentrated to a foam that was flash chromatographed on silica gel (2% EtOH/CH2Cl2) to give disaccharide 81 (156 mg) in 92% yield.

Method B: The coupling reaction between 33 (66 mg, 0.144 mmol) and 80 (30 mg, 0.12 mmol) was carried out at room temperature in dichloromethane using DMTST (2.5 eq) as
promoter. The reaction was finished in 5 hours as judged by TLC (4% ethanol in benzene). After purification, disaccharide 81 was obtained in 75% yield.

Method C: The coupling reaction between 33 (66 mg, 0.144 mmol) and 80 (30 mg, 0.12 mmol) was carried out essentially as in method A, but using trifluoromethanesulfonic acid (0.6 eq). The reaction was finished in 25 min and after similar work-up to afford disaccharide 81 in 77% yield.

Method D: Attempted coupling reaction between 36 (1.2 eq) and 80 (1.0 eq) was carried out in similar condition except using trifluoromethanesulfonic acid (1.0 equiv.). The reaction was run at -30 °C for 5 hours, no coupling product 81 was detected.

Method E: The coupling reaction between 78 (72 mg, 0.144 mmol) and 80 (30 mg, 0.12 mmol) was carried out essentially as in method A but using trifluoromethanesulfonic acid (1.0 eq), reaction was generally finished in 20 min and after similar work-up afforded disaccharide 81 in 80% yield.

Compound 81 had: Rf = 0.33 (4% ethanol in benzene); m.p. 215.8-216.9 °C; [α]D -21.2° (c = 1,0, CHCl3); CI-MS (ether) gave m/z (ion, relative intensity): 578.3 ([M+1]+, 63.1 %); 1H-NMR (CDCl3) δ (ppm): 7.80 (m, 2H, Phth), 7.67 (m, 2H, Phth), 5.82 (dd, 1H, J2,3' = 9.1 Hz, H-3'), 5.42 (d, 1H, J1,2' = 8.5 Hz, H-1'), 5.14 (dd, 1H, J4,5' = 10.2 Hz, H-4'), 5.07 (d, 1H, J1,2 = 5.1 Hz, H-1), 4.37 (dd, 1H, J3,4 = 7.9 Hz, H-3), 4.32 (dd, 1H, J5,68 = 12.4 Hz, H-6a), 4.28 (dd, 1H, J2,3 = 10.6 Hz, H-2'), 4.13 (dd, 1H, J5,68' = 2.4 Hz, H-6b'), 4.06 (dd, 1H, J2,3 = 2.4 Hz, H-2), 3.96 (dd, 1H, J4,5 = 1.2 Hz, H-4), 3.93 (m, 2H, H-6a, H-6b), 3.86 (ddd, 1H, J2,3' = 4.6 Hz, H-5'), 3.67 (m, 1H, H-5), 2.09, 2.00, 1.84 (3s, 9 H, 3xOAc), 1.37 (s, 3H, Me), 1.21 (s, 3H, Me), 0.99 (s, 6H, Me2); 13C-NMR (CDCl3) δ (ppm): 170.7, 170.1, 169.5, (C=O, 3xOAc), 109.2 (C-O-C), 107.9 (C-O-C), 99.3 (C-1'), 95.8 (C-1), 71.5 (C-5), 70.8 (C-4), 70.6 (C-3'), 70.6 (C-3), 70.1 (C-2), 69.3 (C-6), 69.0 (C-4'), 67.4 (C-5), 62.0 (C-6'), 54.5 (C-2'), 25.8, 25.3, 24.6, 24.2 (4C, 2xMe2), 20.7, 20.6, 20.4 (3xOAc).

Anal. Calcd for C32H39NO15 (677.64): C, 56.68; H, 5.80; N, 2.06. Found: C, 56.69; H, 5.98; N, 1.88.
O-(2,3,4,6-tetra-O-benzoyl-β-D-galactopyranosyl)-(1→6)-1,2:3,4-di-O-isopropylidene-α-D-galactopyranoside 82

Method A: Para-acetamidophenyl 2,3,4,6-tetra-O-benzoyl-1-thio-β-D-galactopyranoside 76 (100 mg, 0.134 mmol) and 1,2:3,4-di-O-isopropylidene α-D-galactose 80 (29 mg, 0.11 mmol) were dissolved in dry dichloromethane (2 mL) under nitrogen and pulverized molecular sieves (4 Å, 100 mg) was added. The mixture was stirred at room temperature for 3 hours. The mixture was cooled to -30°C and was added N-iodosuccinimide (46 mg, 0.20 mmol) and trifluoromethanesulfonic acid (13 μL) was added. The reaction was essentially complete (as judged by TLC) after 10 min. The mixture was then diluted with dichloromethane (10 mL) and filtered through celite. The filtrate was washed with 10% aqueous sodium thiosulfate (10 mL), and saturated aqueous sodium bicarbonate (2x10 mL), and brine (10 mL). The solution was dried (Na₂SO₄) and concentrated to a foam that was flash chromatography on silica gel (ethyl acetate/hexane, 3:1) to afford the titled disaccharide (87 mg) in 94% yield.

Method B: The reaction between 76 and 80 was carried out essentially as in method A, no detected coupling product after 5 hours at -30 °C could be observed.

Compound 82 had: m.p. 87-89°C; [α]D +50° (c = 1.0, CHCl₃); IR (KBr νcm⁻¹): 2051, 1729, 1602, 1452, 1266, 1111, 1069, 1027, 711; ¹H-NMR (CDCl₃) δ (ppm): 8.09-7.19 (m, 20H, Aromatic), 5.92 (dd, 2H, J₄,₅ = 0.9 Hz H-4'), 5.79 (dd, 1H, J₂,₃ = 10.4 Hz, H-2'), 5.58 (dd, 1H, J₃,₄ = 3.4 Hz, H-3'), 5.39 (d, 1H, J₁,₂ = 9.8 Hz, H-1), 4.99 (d, 1H, J₁,₂ = 8.0 Hz, H-1'), 4.65 (dd, 1H, J₅,α' = 6.4, J₆,α = 11.0 Hz, H-6a', 4.40 (dd, 1H, J₅,α = 6.8 Hz, H-6b'), 4.39 (dd, 1H, J₃,₄ = 7.9 Hz, H-3), 4.32 (m, 1H, H-5'), 4.20 (dd, 1H, J₂,₃ = 2.4 Hz, H-2), 4.09 (dd, 1H, J₄,₅ = 1.5 Hz, H-4), 5.58 (dd, 1H, J₃,₄ = 3.4 Hz, H-3), 4.64 (dd, 1H, J₂,₃ = 9.8 Hz, H-2), 4.03 (m, 1H, H-5), 3.88 (m, H-6a, H-6b), 1.37, 1.22, 1.19, 1.17 (4s, 12H, 2xCMe₂); ¹³C-NMR (CDCl₃) δ (ppm): 166.0, 165.5, 165.3 (C=O), 147.0-124.4 (30C, Aromatic), 109.2 (C-O-C), 108.4 (C-O-C), 101.7 (C-1), 96.1 (C-1'), 71.5, 70.9, 70.5, 70.3, 69.6, 68.1, 67.4, 62.0 (C-2 - C-5, C-2' - C-5'), 68.4 (C-6), 63.0 (C-6).

133

Para-nitrophenoxy O-(3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-β-D-glucopyranosyl)-(1→6)-2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 83

Ethyl 3,4,6-tri-O-acetyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 32 (110 mg, 0.21 mmol) and para-nitrophenoxy 2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 64 (107 mg, 0.17 mmol) were dissolved in dry dichloromethane (2 mL) under nitrogen and pulverized molecular sieves (4 Å, 200 mg) was added. The mixture was stirred at room temperature for 3 h, cooled to -30°C and NIS (57 mg, 0.34 mmol) and TIOH (3.0 μL) was added. The reaction was essentially complete (as judged by TLC) after 15 min. The reaction mixture was then diluted with dichloromethane (10 mL) and filtered through a layer of celite. The filtrate was washed with 10% aqueous sodium thiosulfate (10 mL), saturated aqueous sodium bicarbonate (2x10 mL) and brine (10 mL). The solution was dried (Na₂SO₄) and concentrated to a foam that was flashchromatographed on silica gel (3:2, ethyl acetate/hexane) to give disaccharide 83 (137 mg) in 78% yield: m.p. 135.1-136.3 °C; [α]D
+81.2° (c = 1.2, CHCl₃); (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 892.3 ([M-HSPhNO₂]⁺, 5.7%), 612.1 ([M-3,4,6-O-tri-acetyl-2-phthalimido-2-deoxy-Glc]⁺, 12.5%); ¹H-NMR (CDCl₃) δ (ppm): 8.20-7.15 (m, 19H, Aromatic), 5.79 (d, 1H, H-4), 5.68 (dd, 1H, J₃,₄= 9.1 Hz, H-3'), 5.64 (dd, 1H, J₂,₃ = 9.8 Hz, H-2), 5.52 (dd, 1H, J₃,₄ = 3.2 Hz, H-3), 5.46 (d, 1H, J₁',₂ = 8.5 Hz, H-1'), 5.14 (dd, 1H, J₄',₅ = 10.1 Hz, H-4'), 5.01 (d, 1H, J₁,₂ = 9.8 Hz, H-1), 4.33 (dd, 1H, J₂,₃ = 9.8 Hz, H-2'), 4.23 (m, 2H, H-6b, H-5'), 4.21 (dd, 1H, J₅,₆a = 2.3, J₆a,₆b = 12.3 Hz, H-6a), 3.94 (dd, 1H, J₅,₆a = 2.4, J₆a,₆b = 11.2 Hz, H-6a), 3.79 (dd, 1H, J₅,₆b = 7.4 Hz, H-6b), 3.74 (m, 1H, H-5), 2.08, 2.00, 1.85 (3xAc); ¹³C-NMR (CDCl₃) δ (ppm): 170.6, 170.1, 169.4 (3C, C=O, Ac), 165.2, 165.1, 165.0 (3C, C=O, Bz), 147.0-123.6 (30C, Aromatic), 98.2 (C-1'), 84.2 (C-1), 77.1 (C-5'), 72.5 (C-3), 72.1 (C-5), 70.7 (C-3'), 68.7 (2C, C-4', C-6), 68.5 (C-4), 67.4 (C-2), 61.7 (C-6), 54.4 (C-2'), 20.7, 20.5, 20.4 (3xAc).
Para-Nitrophenyl O-(3,6-di-O-benzyl-2-deoxy-2-phthalimido-β-D-glucopyranosyl)-(1→6)-2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 84

Ethyl 3,6-di-O-benzyl-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 41 (70 mg, 0.13 mmol) and para-nitrophenyl 2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 64 (69 mg, 0.11 mmol) were dissolved in dry dichloromethane (2 mL) under nitrogen and pulverized molecular sieves (4 Å, 120 mg) were added. The mixture was stirred at room temperature for 3 hours then cooled to -30°C. NIS (49.5 mg, 0.22 mmol) and TIOH (2 μL). The reaction was essentially complete (as judged by TLC) after 10 min. The mixture was then diluted with dichloromethane (10 mL) and filtered through celite. The filtrate was washed with 10% aqueous sodium thiosulfate (10 mL), saturated aqueous sodium bicarbonate (2x10 mL) and brine (10 mL). The solution was dried (Na₂SO₄) and concentrated to a foam which was flash chromatographed on silica gel (1:3, Ethyl acetate/hexane) to isolate disaccharide 84 (116 mg) in 89% yield: m.p. 103.4-105.2 °C; [α]D +71.3° (c = 1.3, CHCl₃); IR (Thin film, νcm⁻¹): 3480, 3064, 3030, 2917, 1775, 1721, 1599, 1582, 1518, 1545, 1390, 1341, 1270, 1083, 1069, 1027, 853, 751, 711; ¹H-NMR (CDCl₃) δ (ppm): 8.16 - 6.91 (m, 19H, Aromatic), 5.76 (d, 1H, J₄,₅ < 1.0 Hz, H-4), 5.59 (dd, 1H, J₂,₃ = 9.8 Hz, H-2), 5.47 (dd, 1H, J₃,₄ = 3.2 Hz, H-3), 5.22 (d, 1H, J₁,₂ = 7.9 Hz, H-1), 4.90 (d, 1H, J₁,₂ = 9.9 Hz, H-1), 4.72 - 4.49 (AB, A’B’, 4H, 2xOCH₂), 4.19 - 4.13 (m, 3H, H-2’, H-3’, H-5’), 3.88 (dd, 1H, J₅,₆a’ = 3.2, J₆a’,₆b’ = 12.2 Hz, H-6a’), 3.81(dd, J₅,₆a = 7.8, J₅,₆b = 9.5 Hz, H-5), 3.73-3.68 (m, 3H, H-6a, H-6b, H-6b’), 3.57 (dd, 1H, J₂,₃’ = 4.9, J₂,₅’ = 9.6 Hz, H-4’); ¹³C-NMR (CDCl₃) δ (ppm): 165.2, 165.1, 165.1 (3C, C=O, Bz), 147.1-123.3 (42 C, Aromatic), 98.6 (C-1’), 84.4 (C-1), 78.5 (C-5’), 77.2 (C-3’), 74.4 (C-5), 74.3 (OCH₂), 73.8 (OCH₂), 73.5 (C-4’), 70.6 (C-6), 68.5 (C-4), 68.3 (C-6’), 67.5 (C-2).
Anal. Calcd for C₆₁H₁₂₀₁₉N₂S (1101.15): C, 66.53; H, 4.76; N, 2.55; S, 2.91.

Para-Nitrophenyl O-(2,3,4,6-tetra-O-benzoyl-β-D-galactopyranosyl)-(1→6)-2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 85

Method A: Phenyl 2,3,4,6-tetra-O-benzoyl-1-thio-β-D-galactopyranoside 49 (100 mg, 0.145 mmol) and para-nitrophenyl 2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 64 (76 mg, 0.12 mmol) were dissolved in dry dichloromethane (2 mL) under nitrogen and pulverized molecular sieves (4 Å, 150 mg) were added. The mixture was stirred at room temperature for 3 hours then cooled to -30°C. NIS (54 mg, 0.24 mmol) and TlOH (6.4 µL) were then added. The reaction was essentially complete (as judged by TLC) after 20 min. The mixture was then diluted with dichloromethane (10 mL) and filtered through celite. The filtrate was washed with 10% aqueous sodium thiosulfate (10 mL), saturated aqueous sodium bicarbonate (2x10 mL) and brine (10 mL). The solution was dried (Na₂SO₄) and concentrated to a foam that was flash chromatographed on silica gel (3:5, ethyl acetate/hexane) to give disaccharide 85 (118 mg) in 81% yield.

Method B: The coupling reaction between para-acetamidophenyl 2,3,4,6-tetra-O-benzoyl-1-thio-β-D-galactopyranoside 77 (40 mg, 0.053 mmol) and thioglycoside 64 (27.5 mg, 0.044 mmol) was carried out essentially as in method A, except that TlOH (1.0 equiv.) was used. The glycosylation reaction was generally finished in 25 min and after similar work-up and purification to give disaccharide 85 (46.2 mg) in 87% yield.

Compound 85 had: m.p. 143.4-145.9 °C; [α]D +108° (c = 1.0, CHCl₃); IR (thin film, ν cm⁻¹): 1729, 1600, 1518, 1451, 1342, 1286, 1093, 853, 710; (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 1208.2 [(M+1)⁺, 1.2%], 1053.3 [(M+1-HSPHNO₂)⁺, 6.6%]; ¹H-NMR (CDCl₃) δ (ppm): 8.12-7.19 (m, 39H, Aromatic), 5.95 (d, 2H, H-4, H-4’), 5.82 (dd, 1H, J₂₃ = 10.5 Hz, H-2’), 5.74 (dd, 1H, J₁₂ = 9.8 Hz, H-2), 5.58 (dd, 1H, J₃₄ = 3.3 Hz, H-3), 5.56 (dd, 1H, J₃₄ = 3.3 Hz, H-3’), 5.00 (d, 1H, J₁₂ = 9.8 Hz, H-1), 4.91 (d, 1H, J₁₂ = 8.0 Hz, H-1’), 4.48-4.27 (m, 4H, H-5, H-5', H-6a', H-6b’), 4.16 (dd,
1H, J_5,6a = 4.2, J_6a,6b = 10.5 Hz, H-6a), 3.92 (dd, 1H, J_5,6b = 7.5 Hz, H-6b); ¹³C-NMR (CDCl₃) δ (ppm): 165.9, 165.5 (2C), 165.2, 165.1 (2C), 168.1 (8x C=O), 146.9-123.8 (48C, Aromatic), 101.4 (C-1'), 84.7 (C-1), 77.1 (C-5), 72.54 (C-3), 71.7 (C-3'), 71.4 (C-5'), 69.9, 69.6 (C-2), 68.5, 68.0 (C-4, C-4'), 68.1 (C-6), 67.5 (C-2), 61.8 (C-6').

Para-Nitrophenyl O-(2,3,4-tri-O-benzoyl-6-tert-butyldimethylsilyl-β-D-galactopyranosyl)-(1→6)-2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 86

Phenyl 2,3,4-tri-O-benzoyl-6-tert-butyldimethylsilyl-1-thio-β-D-galactopyranoside 53 (60 mg, 0.086 mmol) and para-nitrophenyl 2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 64 (45 mg, 0.072 mmol) were dissolved in dry dichloromethane (2 mL) under nitrogen and pulverized molecular sieves (4 Å, 100 mg) was added. The mixture was stirred at room temperature for 3 hours and cooled to -30 °C. NIS (35 mg, 0.157 mmol) and TfOH (3.2 µL) were then added. The reaction was essentially complete (as judged by TLC) after 20 min. The mixture was then diluted with dichloromethane (25 mL) and filtered through celite. The filtrate was washed with 10% aqueous sodium thiosulfate (10 mL), saturated aqueous sodium bicarbonate (2x10 mL) and brine (10 mL). The solution was dried (Na₂SO₄) and concentrated to a foam that was flash chromatographed on silica gel (0.5% ethanol in dichloromethane) to afford desired disaccharide 86 (70 mg) in 82% yield: m.p. 109.5-111.9°C; [α]_D +128.2° (c = 1.1, CHCl₃); IR (thin film, ν_cm): 3067, 2939, 2856, 1731, 1601, 1515, 1451, 1281, 1101, 1070, 844, 752, 709; (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 1194.5 ([M]^+ 0.5%), 1137.5 ([M-tBu]^+, 2.5%), 1096.4 ([M-PhCO₂H]^+, 0.9%), 1074.5 ([M-HSiBuMe₃]^+, 0.3%), 1039.5 ([M-HSPhNO₂]^+, 0.4%); ¹H-NMR (CDCl₃) δ (ppm): 8.12-7.19 (m, 34 H, Aromatic), 5.94 (d, 1H, J₄,₅ < 1.0 Hz, H-4'), 5.89 (d, 1H, J₄,₅' < 1.0 Hz, H-4'), 5.74 (dd, 1H, J₂,₃ = 10.4 Hz, H-2'), 5.73 (dd, 1H, J₂,₃ = 9.8 Hz, H-2), 5.56 (dd, 1H, J₄,₃ = 3.3 Hz, H-3), 5.44 (dd, 1H, J₃,₄ = 3.4 Hz, H-3'), 4.96 (d, 1H, J₃,₂ = 9.9 Hz, H-1), 4.83 (d, 1H, J₄,₃ = 7.9 Hz, H-1'),
4.30 (ddd, 1H, J₅,₆a = 4.2, J₅,₆b = 7.4 Hz, H-5), 4.14 (dd, 1H, J₆a,₆b = 10.6 Hz, H-6a), 3.94 (ddd, 1H, J₅',₆a' = 5.8, J₅,₆a' = 8.0 Hz, H-5'), 3.88 (dd, 1H, H-6b), 3.76 (dd, 1H, J₆a',₆b' = 9.9 Hz, H-6a'), 3.60 (dd, 1H, H-6b), 0.77 (s, SiC(CH₃)₃), -0.04, -0.17 (s, 2x SiCH₃); ¹³C-NMR (CDCl₃) δ (ppm): 165.6, 165.4, 165.3, 165.3, 168.2, 168.1 (6 x C=O), 147.0-123.8 (42C, Aromatic C), 101.5 (C-1'), 84.8 (C-1), 77.3 (C-5), 74.2 (C-5'), 72.6 (C-3), 72.0 (C-3'), 70.0 (C-2), 68.6 (C-4), 68.1 (C-6), 67.65 (C-4'), 67.6 (C-2'), 60.5 (C-6'), 25.7 (3x Me₃), 25.4 (SiC), 18.1 (SiCH₃).

Para-nitrophenyl O-(2,3,4,6-tetra-O-benzyl-α or (β)-D-galactopyranosyl)-(1→6)-2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 87

Method A: Para-nitrophenyl 2,3,4,6-tetra-O-benzyl-1-thio-β-D-galactopyranoside 52 (68 mg, 0.1 mmol) and para-nitrophenyl 2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 64 (63 mg, 0.1 mmol) were dissolved in dry dichloromethane (2 mL) under nitrogen and pulverized molecular sieves (4 Å, 100 mg) was added. The mixture was stirred at room temperature for 3 hours and cooled to -30 °C. NIS (56.2 mg, 0.25 mmol) and TFOH (12.6 μL) were then added. The coupling reaction was complete (as judged by TLC) after 65 min. The mixture was then diluted with dichloromethane (10 mL) and filtered through a layer of celite. The filtrate was washed with 10% aqueous sodium thiosulfate (10 mL), saturated aqueous sodium bicarbonate (2x10 mL) and brine (10 mL). The solution was dried (Na₂SO₄) and concentrated to a syrup that was chromatographed on silica gel (ethyl acetate-hexane, 1:4) to isolate disaccharides 87 (87.9 mg) in 76% as a mixture of α/β (= 4/1) anomers as judged by ¹H NMR spectrum.

Method B: The coupling reaction between para-acetamidophenyl 2,3,4,6-tetra-O-benzyl-1-thio-β-D-galactopyranoside 77 (33 mg, 0.048 mmol) and thioglycoside 64 (25 mg, 0.040 mmol) was carried out essentially as in method A, but using trifluoromethanesulfonic acid (1.2 equiv.). The glycosylation reaction was generally finished in 25 min and after similar work-up and purification procedure to give disaccharide (42 mg) in 92% yield as a mixture of α/β (=3/1) anomers as judged by ¹H NMR spectrum. The
anomer mixture was then successfully separated by radial chromatography on a silica gel Chromatotron (1 mm plate) using 1% tBuOH in methylene chloride as eluent.

Compound 87a had: $\alpha_d +62.0^\circ$ (c = 1.0, CHCl$_3$); $^1$H-NMR (500 MHz, CDCl$_3$) $\delta$ (ppm): 8.13-7.20 (m, 39H, Aromatic), 5.94 (d, 1H, $J_{4.5} < 1.0$ Hz, H-4), 5.73 (dd, 1H, $J_{2.3} = 9.9$ Hz, H-2), 5.59 (dd, 1H, $J_{3.4} = 3.4$ Hz, H-3), 5.00 (d, 1H, $J_{1.2} = 9.9$ Hz, H-1), 4.90-4.64 (m, 6H, 3xOCH$_2$), 4.79 (d, 1H, $J_{1.2} = 3.7$ Hz, H-1'), 4.38-4.32 (m, 3H, H-5, OCH$_2$), 4.02 (dd, 1H, $J_{3.4} = 10.5$ Hz, H-2'), 3.99 (m, 1H, H-5'), 3.89 (d, 1H, $J_{4.5} < 1.0$ Hz, H-4'), 3.87 (dd, 1H, $J_{3.4} < 1.0$ Hz, H-3'), 3.86 (dd, 1H, $J_{5.6} = 6.1$, $J_{6.6} = 11.0$ Hz, H-6a), 3.73 (dd, 1H, $J_{5.6} = 7.3$ Hz, H-6b), 3.50 (dd, 1H, $J_{5.6} = 6.3$, $J_{6.6} = 9.3$ Hz, H-6a'), 3.44 (dd, 1H, $J_{5.6} = 6.5$ Hz, H-6b'); $^{13}$C-NMR (125.7 MHz, CDCl$_3$) $\delta$ (ppm): 165.4, 165.3, 165.1 (3xC=O), 147.0-123.7 (48C, Aromatic), 98.8 (C-1'), 84.3 (C-1), 79.0 (C-3'), 76.5 (C-5), 74.9 (C-5'), 74.8 (C-4'), 73.7 (OCH$_2$), 73.4 (OCH$_2$), 73.2 (2C, 2xOCH$_2$), 72.7 (C-3), 69.9 (C-2'), 69.2 (C-6'), 68.7 (C-4), 67.7 (C-2), 67.4 (C-6).

Para-Nitrophenylsulfonyl 1,3,4,6-Tetra-O-benzoyl-β-D-galactopyranoside 88

Para-nitrophenyl 2,3,4,6-tetra-O-benzoyl-1-thio-β-D-galactopyranoside 50 (150 mg, 0.204 mmol) was dissolved in dry dichloromethane (15 mL). The solution was cooled to -40 °C and a solution of m-chloroperoxybenzoic acid (67 mg, 0.388 mmol) in dichloromethane (7 mL) was added. The reaction was kept at -40 °C for 15 min and then allowed to attain temperature to 0 °C. After 45 min, added additional mCPBA (7 mg) and stirred at 0 °C for additional 2 hours. TLC (ether-hexane 3:1) showed a clear conversion starting material (Rf = 0.43) to product (Rf = 0.19). The mixture was diluted with methylene chloride (15 mL) and washed with saturated sodium bicarbonate and water, dried (Na₂SO₄) and concentrated under reduced pressure. The residue was purified by silica gel chromatography using ether-hexane (2:1, v/v) as eluent to give titled product (103 mg) in 65% yield: [α]D +21° (c = 1.0, CHCl₃); 1H-NMR (CDCl₃) δ (ppm): 8.27-7.26 (m, 24H, aromatic), 6.11 (dd, 1H, J₂₃ = 10.0 Hz, H-2), 5.94 (dd, 1H, J₄₅ < 1.0 Hz, H-4), 5.66 (dd, 1H, J₃₄ = 3.2 Hz, H-3), 4.73 (d, 1H, J₁₂ = 9.8 Hz, H-1), 4.55 (dd, 1H, J₅₆ = 8.7, J₆₇ = 12.7 Hz, H-6a), 4.37-4.28 (m, 2H, H-5, H-6b); FAB-MS (pos.) Calcd. for C₄₀H₃₁NO₁₁S: 733.7, Found: 733.6.

Para-Nitrophenyl O-(3,4,6-tri-O-acetyl-2-deoxy-2-phthalamido-β-D-glucopyranosyl)-(1→6)-2,3,4-tri-O-benzyl-1-thio-β-D-galactopyranoside 89

Ethyl 3,4,6-tri-O-acetyl-2-deoxy-2-phthalamido-1-thio-β-D-glucopyranoside 32 (70 mg, 0.145 mmol) and para-nitrophenyl 2,3,4-tri-O-benzyl-1-thio-β-D-galactopyranoside 66 (102 mg, 0.174 mmol) were dissolved in dry dichloromethane (2 mL). To this mixture was added pulverized molecular sieves (4 Å, 150 mg). After stirring at room temperature for 3 hours, the reaction mixture was added methyl trifluoromethanesulfonate (196 µL, 1.74 mmol) and stirred for additional 10 hours. The mixture was then diluted with dichloromethane (10 mL) and filtered through celite. The filtrate was washed saturated aqueous sodium bicarbonate (2x10 mL) and brine (10 mL). The solution was dried (Na₂SO₄) and concentrated to a foam that was chromatographed on silica gel (2:5, Ethyl acetate/hexane) to afford disaccharide 89 (113 mg) in 77% yield:
m.p. 84.3-85.9 °C; [α]D -3.5° (c = 1.0, CHCl₃); IR (thin film, v cm⁻¹): 3029, 2904, 1749, 1718, 1579, 1515, 1454, 1387, 1339, 1231, 1083, 1043, 905, 853, 750, 699; (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 850.4 ([M-HSPhNO]⁺, 0.7%); ¹H-NMR (CDCl₃) δ (ppm): 7.93 -7.22 (m, 23H, Aromatic), 5.67 (dd, 1H, J₂,₃ = 9.2 Hz, H-3'), 5.43 (d, 1H, J₁,₂ = 8.7 Hz, H-1'), 5.16 (dd, 1H, J₄,₅ = 10.1 Hz, H-4'), 4.90-4.60 (m, 6H, 3xOCH₂), 4.62 (d, 1H, J₁,₂ = 9.5 Hz, H-1), 4.30 (dd, 1H, J₂,₃ = 10.6 Hz, H-2'), 4.27 (dd, 1H, J₅,₆a = 4.4, J₆a,₆b = 12.5 Hz, H-6a'), 4.07 (dd, 1H, J₅,₆b = 7.4 Hz, H-6b'), 3.90 (dd, 1H, J₂,₃ = 9.1 Hz, H-2), 3.88 (dd, 1H, J₅,₆a = 3.0, J₆a,₆b = 10.2 Hz, H-6a), 3.82 (d, 1H, J₄,₅ < 1.0 Hz, H-4), 3.70 (m, 1H, H-5'), 3.53-3.45 (m, 2H, H-3, H-5), 2.03, 2.71, 1.84 (3s, 3xAc); ¹³C-NMR (CDCl₃) δ (ppm): 170.6, 170.0, 169.4 (3C, C=O, Ac), 145.9-123.6 (30C, Aromatic), 97.7 (C-1'), 85.4 (C-1), 853.8 (C-5), 77.6 (C-3), 76.3 (C-2), 75.6, 74.6, 72.5 (3xOCH₂), 73.1 (C-4), 71.9 (C-5'), 70.7 (C-3'), 68.6 (C-4'), 67.9 (C-6), 61.7 (C-6'), 54.6 (C-2'). 20.7, 20.5, 20.4 (3xAc).

Phenyl O-(2,3,4,6-tetra-O-benzoyl-β-D-galactopyranosyl)-(1→6)-2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 90

Ethyl 2,3,4,6-tetra-O-benzoyl-1-thio-β-D-galactopyranoside 48 (92 mg, 0.14 mmol) and phenyl 2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 63 (70 mg, 0.12 mmol) were dissolved in dry dichloromethane (2 mL) under nitrogen and pulverized molecular sieves (4 Å, 150 mg) was added. The mixture was stirred at room temperature for 3 hours and cooled to -30 °C. N-Iodosuccinimide (46 mg, 0.24 mmol) and triflic acid (2.1 µL) were then added. The reaction was essentially complete (as judged by TLC) after 5 min. The mixture was then diluted with dichloromethane (10 mL) and filtered through celite. The filtrate was washed with 10% aqueous sodium thiosulfate (10 mL), saturated aqueous sodium bicarbonate (2x10 mL) and brine (10 mL). The solution was dried (Na₂SO₄) and concentrated to a foam that was flash chromatographed on silica gel (3:7, ethyl acetate/hexane) to isolate disaccharide 90 (124 mg) in 89% yield: m.p. 87.5-89.4 °C; [α]D +54.3° (c = 1.2, CHCl₃); IR (thin film, v cm⁻¹): 3065, 2934, 1726, 1602, 1451, 1315,
1268, 1177, 1105, 1069, 1027, 754, 709; (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 1163.3 ([M]+, 2.3%), 1053.4 ([M+1-HSPHNO,]+, 5.4%); 1H-NMR δ (CDCl3): 8.11-7.20 (m, 40H, Aromatic), 6.00 (d, 1H, J3,5<1.0 Hz, H-4), 5.89 (d, 1H, H-4'), 5.73 (dd, 1H, J2,3 = 9.8 Hz, H-2), 5.58 (dd, 1H, J3,4 = 3.0 Hz, H-3), 5.57 (H-3'), 5.42 (H-2'), 5.32 (H-1'), 5.02 (d, 1H, J1,2 = 9.8 Hz, H-1), 4.56-4.48 (m, H-5', H-6a'), 4.32 (dd, 1H, J5,6b = 3.3, J6a,6b = 12.2 Hz, H-6b'), 4.30 (m, 1H, H-5), 3.96 (dd, 1H, J5,6a = 7.3, J6a,6b = 9.6 Hz, H-6a), 3.80 (dd, 1H, J5,6b = 5.8 Hz, H-6b); 13C-NMR (CDCl3) δ (ppm): 165.9, 165.8, 165.7, 165.4 (C), 165.3, 165.1 (C=O, Bz), 134.3-128.1 (48C, Aromatic), 106.0 (C-1'), 85.7 (C-1), 82.1 (C-2'), 81.7 (C-5'), 77.4 (C-3'), 76.0 (C-5), 73.2 (C-3), 70.4 (C-4'), 68.2 (C-4), 67.9 (C-2), 65.1 (C-6), 63.7 (C-6').

Para-Acetamidophenyl O-(2,3,4,6-tetra-O-benzoyl-β-D-galactopyranosyl)-(1→6)-2,3,4-tri-O-benzoyl-1-thio-β-D-galactopyranoside 91

To a suspension of 85 (140 mg, 0.116 mmol) in absolute ethanol (5 mL) was added tin(II) chloride dehydrate (132 mg, 0.580 mmol). The mixture was heated to 70 °C and stirred for 1 hour. The solution was then cooled, poured into ice-water (50 mL) and the pH was adjusted to 7-8 with sodium bicarbonate. Dichloromethane (50 mL) was added and the organic phase was washed with water (2x25 mL). The dried organic phase (sodium sulfate) was filtered and evaporated. The crude product was then dissolved in pyridine (3 mL) and acetyl anhydride (2 mL) and stirred for 2 hours. The mixture was concentrated and the product was purified by silica gel column chromatography to afford 91 (118 mg) in 83% yield: m.p. 125.4-127.1 °C; [α]D +79.1° (c = 1.0, CHCl3); IR (thin film, cm⁻¹): 3359, 3065, 2968, 1726, 1594, 1520, 1493, 1451, 1269, 1070, 910, 837, 802, 710, 684; (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 1221.6 ([M+1]⁺, 0.4%), 1098.4 ([M-PhCOOH]⁺, 0.3%), 1054.5 ([M+1-HSPHNAc]⁺, 1.0%), 1053.4 ([M-HSPHNAc]⁺, 1.6%); 1H-NMR (CDCl3) δ (ppm): 8.27-7.18 (m, 39H, Aromatic), 5.89 (d, 1H, H-4), 5.85 (d, 1H, H-4'), 5.69 (dd, 1H, J2,3 = 9.8 Hz, H-2), 5.68 (dd, 1H, J2,3 = 9.8 Hz, H-2'), 5.51(dd, 1H, J3,4 = 3.5 Hz , H-3'), 5.47 (dd, 1H, J3,4 = 3.4 Hz, H-3), 4.90 (d,

**Para-Nitrophenyl O-(2,3,4-tri-O-benzyl-α-L-fucopyranosyl)-(1→3)-4,6-O-benzylidene-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 94**

To a solution of ethyl 2,3,4-tri-O-benzyl-1-thio-β-D-fucopyranoside 93 (100 mg, 0.22 mmol) and para-nitrophenyl 4,6-O-benzylidene-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 39 (96 mg, 0.18 mmol) in dry dichloromethane (2 mL) was added powdered molecular sieves 4 Å (200 mg) under nitrogen. The mixture was stirred at room temperature for 3 hours and then cooled to -30°C. N-Iodosuccinimide (72.5 mg, 0.32 mmol) and triflic acid (3.2 μL) were then added. The reaction was essentially complete (as judged by TLC) in 5 min. The mixture was then diluted with dichloromethane (10 mL) and filtered through celite. The filtrate was washed with 10% aqueous sodium thiosulfate (10 mL), saturated aqueous sodium bicarbonate (2x10 mL) and brine (10 mL). The solution was dried (Na$_2$SO$_4$) and concentrated. The residue was purified on radial silica gel.
chromatography (1 mm plate) using ethyl acetate/hexane (1:5) as eluent to give disaccharide 94 (124 mg) in 72% yield: m.p. 91.4-93.1 °C; [α]D +33.6° (c = 1.2, CHCl3); IR (thin film, ν cm⁻¹): 3063, 3030, 2928, 2872, 1776, 1715, 1597, 1581, 1517, 1496, 1453, 1387, 1340, 1095, 1053, 847, 750, 720, 699, 647; (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 952.4 ([M+1]+, 1.0%); ¹H-NMR (CDCl₃) δ (ppm): 8.13-6.98 (m, 24H, Aromatic), 5.89 (d, 1H, J₁₂ = 10.6 Hz, H-1), 5.56 (s, 1H, PhCH), 4.79 (d, 1H, J₁₂ = 1.2 Hz, H-1'), 4.77 (AB pattern 1H, H-A of OCH₂), 4.69 (dd, 1H, J₃₄ = 9.7 Hz, H-3), 4.50-4.21 (m, 6H, H₂, 2×OCH₂), 4.02 (tert, 1H, J₅₆ = 6.5 Hz H-5'), 3.84-3.67 (m, 6H, H-6a, H-B of OCH₂, H-5, H-4', H-2', H-4), 3.46 (d, 1H, J₃₄ < 1.0 Hz, H-3'). 0.86 (d, 3H, H-6'); ¹³C-NMR (CDCl₃) δ (ppm): 168.3, 167.4 (2C, 2xC=O, Phth.,), 146.8-123.4 (48C, Aromatic), 101.2 (PhCH=), 99.7 (C-1'), 82.7 (C-1), 81.7 (C-5), 79.6 (C-4'), 77.8 (C-3'), 76.4 (C-3), 75.5 (C-2'), 74.7, 73.0, 72.8 (3C, 3xOCH₂), 70.7 (C-4), 68.4 (C-6), 67.4 (C-5'), 54.3 (C-2), 16.4 (C-6').

**Para-Nitrophenyl O-(2,3,4,6-tetra-O-benzoyl-β-D-galactopyranosyl)-(1→3)-4,6-O-benzylidene-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 95**

To a solution of phenyl 2,3,4,6-tetra-O-benzoyl-1-thio-β-D-galactopyranoside 49 (100 mg, 0.145 mmol) and para-nitrophenyl 4,6-O-benzylidene-2-deoxy-2-phthalimido-1-thio-β-D-glucopyranoside 39 (65 mg, 0.121 mmol) in dry dichloromethane (2 mL) was added powdered molecular sieves 4 Å (200 mg) under nitrogen and was stirred at room temperature for 3 hours. The mixture was cooled to -30 °C and N-iodosuccinimide (49 mg, 0.218 mmol) and triflic acid (6.5 µL) were added. The reaction was essentially complete (as judged by TLC) in 25 min. The mixture was then diluted with dichloromethane (10 mL) and filtered through celite. The filtrate was washed with 10% aqueous sodium thiosulfate (10 mL), saturated aqueous sodium bicarbonate (2x10 mL) and brine (10 mL). The solution was dried (Na₂SO₄) and concentrated to a foam that was flash chromatographed on silica gel (1:5, ethyl acetate/Hexane) to afford disaccharide 95 (93 mg) in 71% yield: m.p. 119.7-121.5 °C; [α]D +112.3° (c = 1.74, CHCl₃); IR (neat): 145
3066, 3033, 2925, 2872, 1777, 1726, 1600, 1583, 1518, 1451, 1383, 1341, 11767, 1101, 1070, 1027, 852, 754, 711 cm⁻¹; (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 1113.4 ([M⁺], 0.7%), 1007.3 [M-PhCO₂H]⁺, 0.3%), 958.4 ([M-HPhNO₂]⁺, 0.3%); ¹H-NMR (CDCl₃) δ (ppm): 8.08-7.09 (m, 33H, Aromatic), 5.79 (d, 1H, H₄,₅', < 1.0 Hz, H-4'), 5.71 (d, 1H, J₁,₂ = 10.6 Hz, H-1), 5.64 (s, 1H, PhCH), 5.50 (dd, 1H, J₂,₃ = 10.3 Hz, H-2'), 5.32 (dd, 1H, J₃,₄ = 3.4 Hz, H-3'), 4.93 (d, 1H, J₁,₂ = 8.0 Hz, H-1'), 4.88 (dd, 1H, J₃,₄ = 9.4 Hz, H-3), 4.52 (dd, 1H, J₂,₃ = 10.0 Hz, H-2), 4.42 (dd, 1H, J₅,₆b = 2.5, J₆a,₆b = 8.2 Hz, H-6a), 4.31 (dd, 1H, J₅,₆a = 5.4, J₆a,₆b = 11.0 Hz, H-6a'), 4.27 (dd, 1H, J₅,₆a = 8.3 Hz, H-6b'), 4.00 (dd, 1H, J₄,₅ = 8.8 Hz, H-4), 3.88-3.83 (m, 2H, H-5, H-6b), 3.76 (m 1H, H-5'); ¹³C-NMR (CDCl₃) δ (ppm): 168.5, 167.6 (C=O, Phth.), 165.5, 165.4, 165.4, 164.6 (C=O, PhCO₂), 146.8-123.9 (42C, Aromatic), 102.0 (PhCH), 100.5 (C-1'), 82.8 (C-1), 76.7 (C-3), 71.7 (C-3'), 70.9 (C-5), 70.7 (C-5'), 70.2 (C-2'), 68.5 (C-6), 67.5 (C-4'), 61.0 (C-6'), 53.8 (C-2).

Para-Nitrophenyl O-(2,3,4,6-tetra-O-benzoyl-β-D-galactopyranosyl)-(1→3)-(2,6-di-O-benzoyl-β-D-galactopyranosyl)-(1→4)-O-2,3,6-tri-O-benzoyl-1-thio-β-D-glucopyranoside 97

Phenyl 2,3,4,6-tetra-O-benzoyl-1-thio-β-D-galactopyranoside 49 (48 mg, 0.07 mmol) and para-nitrophenyl 2,2′,3,6,6′-penta-O-acetyl-1-thio-β-D-lactopyranoside 96 (500 mg, 0.05 mmol) were dissolved in dry dichloromethane (2 mL) under nitrogen and pulverized molecular sieves (4 Å) were added. The mixture was stirred at room temperature for 3 hours and cooled to -30°C. N-Iodosuccinimide (28 mg, 0.125 mmol) and TIOH (2.8 µl) were added. After reaction mixture was stirred at -30 °C for 25 min, TLC indicated the completion of reaction. The reaction mixture was then diluted with dichloromethane (10 mL) and filtered through celite. The filtrate was washed with 10% aqueous sodium thiosulfate (10 mL), saturated aqueous sodium bicarbonate (2×10 mL) and brine (10 mL). The solution was dried (Na₂SO₄) and concentrated to a foam that was chromatographed on silica gel (2% ethanol in dichloromethane) to afford trisaccharides 97.
(53.0 mg) in 72% yield: m.p. 115.3-117.2 °C; [α]D +70.2° (c = 1.0, CHCl₃); IR (thin film, νcm⁻¹): 3066, 2931, 1727, 1601, 1583, 1452, 1341, 1268, 1177, 1111, 1070, 1028, 852, 753, 709; (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 1581.6 ([M+1]⁺, 0.8%), 1425.8 ([M-HSPhNO₃]⁺, 3.6%); ¹H-NMR (CDCl₃) δ (ppm): 8.03 - 7.00 (m, 49H, Aromatic), 5.88 (dd, 1H, J₅,₆ = 9.2 Hz, H-3), 5.44 (dd, 1H, J₂,₃ = 9.8 Hz, H-2'), 5.42 (dd, 1H, J₅,₆ = 3.4 Hz, H-3'), 5.37 (dd, 1H, J₁,₂ = 9.4 Hz, H-2), 4.92 (d, 1H, J₁,₂ = 9.9 Hz, H-1') , 4.89 (d, 1H, J₁,₂ = 8.0 Hz, H-1'), 4.53 (d, 1H, J₁,₂ = 8.0 Hz, H-1'), 4.51 (dd, 1H, J₅,₆ =7.3, J₆a,₆b = 11.6 Hz, H-6a'), 4.49 (dd, 1H, J₅,₆ =10.2, J₆a,₆b = 12.2, H-6a), 4.40 (dd, 1H, J₅,₆ = 5.5 Hz, H-6b'), 4.35 (dd, 1H, J₅,₆ = 5.8 Hz, H-6b), 4.28 (m, 1H, H-5'), 4.06 (dd, J₅,₆ < 1.0 Hz, H-4'), 4.00 (dd, 1H, J₄,₅ = 9.8 Hz, H-4), 3.98 (dd, 1H, J₄,₅ = 6.7 Hz, H-6a'), 3.85 (dd, 1H, J₄,₅ = 3.0 Hz, H-3'), 3.83 (m, 1H, H-5), 3.64 (dd 1H, J₅,₆ = 7.4, J₆a,₆b = 11.5 Hz, H-6b'), 3.54 (m, 1H, H-5'); ¹³C-NMR (CDCl₃) δ (ppm): 165.9 (2C), 165.7, 165.5, 165.4 (2C), 165.1, 164.7, 164.2 (9x C=O), 146.8 -123.6 (60C, Aromatic), 101.8 (C-1”), 100.6 (C-1'), 84.1 (C-1), 81.1 (C-3’), 77.2 (C-5), 75.3 (C-4), 73.3 (C-3), 72.3(C-5), 75.7 (C-5”), 71.3, 70.5, 70.1 (3C, C-2’, C-2, C-3’”), 69.2 (C-2”), 68.1 (C-4’), 67.7 (C-4”), 62.8, 62.5, 62.0 (3C, C-6, C-6’, C-6”).

**Para-Nitrophenyl O-(2,3,4-tri-O-benzyl-α-L-fucopyranosyl)-(1→3)-O-(2,6-di-O-benzoyl-4-O-[(2,6-di-O-benzoyl-3,4-O-isopropylidene-β-D-galactopyranosyl)]-(1→4)-1-thio-β-D-glucopyranoside 99**

To a solution of para-nitrophenyl O-(2,6-di-O-benzoyl-3,4-O-isopropylidene-β-D-galactopyranosyl)-2,6-di-O-benzoyl-1-thio-β-D-glucopyranoside 98 (50 mg, 0.054 mmol) and ethyl 2,3,4-tri-O-benzyl-1-thio-β-L-fucopyranoside 93 (31 mg, 0.065 mmol) in dry dichloromethane (3 mL) was added powdered molecular sieves (4 Å, 100 mg) and the mixture was stirred at room temperature for 3 hours. The mixture was then cooled to -30 °C and N-iodosuccinimide (22 mg, 0.097 mmol) and trifluoromethanesulfonic acid (0.94 µL) were added. After stirring at -30 °C for 15 min. TLC showed that the reaction was
finished. The reaction mixture was then diluted with dichloromethane (6 mL) and filtered through celite. The filtrate was washed with 10% aqueous sodium thiosulfate (8 mL), saturated aqueous sodium bicarbonate (2x8 mL) and brine (8 mL). The solution was dried (Na₂SO₄) and concentrated to a foam that was purified by radial silica gel chromatography (1 mm plate) using ethyl acetate-hexane (1:3, v/v) as eluent. Pure 99 (49 mg) was obtained in 68% yield: MS (Electron Spray): 1374.2 ([M+Na]⁺, 30%); IR (thin film, νcm⁻¹): 2924, 1601, 1458, 1372, 1274, 1115, 711; ¹H-NMR (500 MHz, CDCl₃) δ (ppm): 8.06-7.08 (m, 39H, aromatic), 5.72 (dd, 1H, J₃,₄ = 8.5 Hz, H-3), 5.33 (d, 1H J₁,₂ = 3.8 Hz, H-1'), 5.08 (dd, J₂,₃ = 6.7 Hz, H-2'), 5.00 (d, 1H, J₁,₂ = 9.2 Hz, H-1), 4.60 (d, 1H, H-1'), 4.58 (d, 1H, J₅,₆a = 5.3 Hz, H-6a), 4.38 (dd, 1H, J₅,₆b = 6.2, J₆a,₆b = 12.0 Hz, H-6b), 4.23 (dd, 1H, J₅,₄r = 6.7 Hz, H-3'), 4.16 (dd, 1H, J₂,₂ = 8.8 Hz, H-2), 4.03 (dd, 1H, H-4), 3.87 (dd, 1H, J₂,₃r = 10.1 Hz, H-2''), 1.49, 1.23 (2s, 6H, Me, isopropylidene), 1.10 (d, 3H, J₃,₆r = 6.4 Hz, H-6''), ¹³C-NMR (125.7 MHz, CDCl₃) δ (ppm): 165.9, 165.7, 165.0, 164.8 (4xC=O, OBz), 143.3-123.7 (48C, aromatic), 110.9 (C-O-C), 100.2 (C-1'), 98.0 (C-1''), 85.0 (C-1), 79.0 (C-3''), 76.3 (4''), 75.5 (C-3'), 75.0 (C-5), 74.7 (C-3), 74.1 (C-4), 73.9 (2C, CH₂, C-2''), 73.1 (2C, C-2, C-2'), 73.1 (C-4'), 73.0 (2C, 2xCH₂), 75.4 (C-5'), 67.8 (C-5''), 62.9 (2C, C-6, C-6''), 27.4 (isopropylidene), 16.6 (C-6'').
Chapter 4 Synthesis of Sialosides using “Active-Latent” Glycosylation Strategy

4.1 Introduction

Sialic acid-containing glycoconjugates, especially gangliosides, play critical roles in numerous biological phenomena such as cell-cell adhesion,\textsuperscript{191} malignancy,\textsuperscript{192} and cell growth regulation.\textsuperscript{193} They have also been identified as tumor associated antigens\textsuperscript{194} and cell differentiation markers.\textsuperscript{195} Ganglioside GM\textsubscript{3} (Figure 4.1) was first isolated from equine erythrocytes by Yamakawa’s group in 1952.\textsuperscript{196} It has been shown to serve as the precursor in the biosynthetic pathway\textsuperscript{197} of many complex gangliosides and is known to modulate the epidermal growth factor (EGF) and the platelet-derived growth factor (PDGF) receptors.\textsuperscript{198} GM\textsubscript{3} was also found to be expressed in abnormally high concentration in tumor cells.\textsuperscript{27} Given the extreme difficulty of isolating homogeneous gangliosides from natural sources,\textsuperscript{198} effective syntheses are desirable.

Glycosylation using sialic acid-derived donors has been recognized as a most challenging task in carbohydrate chemistry for the following reasons. First, the carboxylic acid function at C-2 electronically disfavors oxonium ion formation, an intermediate necessary for almost all known glycosidation reactions. Secondly, the carboxy group

\begin{itemize}
  \item \textsuperscript{193} Matta, S. G.; Yorke, G.; Roisen, F. J. Develop. Brain Res. 1986, 27, 243.
  \item \textsuperscript{196} Yamakawa, T.; Suzuka, S. J. Biochem. (Tokyo). 1952, 39, 383.
  \item \textsuperscript{197} Bouhous, D.; Bouhous, J.-F. J. Biol. Chem. 1991, 266, 12944.
\end{itemize}
sterically restricts glycoside formation. Thirdly, the lack of a substituent at C-3 precludes possible anchimeric group participation. These combined factors reduce the reactivity of sialyl donors in glycosidation, disfavor glycoside formation and promote an elimination pathway to produce a 2,3-dehydro derivative. Despite these drawbacks, major advances in sialoside syntheses have been achieved in recent years.\textsuperscript{199,200}

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{structure_of_gm3}
\caption{Structure of GM\textsubscript{3}}
\end{figure}

Ganglioside GM\textsubscript{3} has been used as a target for the evaluation of a variety of synthetic methodologies. This trisaccharide sequence was generally synthesized from lactosyl acceptor and sialyl donor building blocks and several synthetic methods have been reported (table 4.1). The first total synthesis of ganglioside GM\textsubscript{3} was achieved by Ogawa \textit{et al.}\textsuperscript{201}\textsuperscript{a} Glycosylation of lactosyl acceptor with methyl (5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-D-glycero-\(\beta\)-D-galacto-2-nonulopyranosyl chloride) onate 4.1 as a glycosyl donor, Hg(CN)\textsubscript{2}-HgBr\textsubscript{2} as promoter gave GM\textsubscript{3} trisaccharide as a mixture of \(\alpha\)- and \(\beta\)-anomers (2:1) in 18\% yield. When a 3-\(\beta\)-phenylthio stereocontoller was introduced into the C-3 position of the sialyl donor 4.2, the yield and stereoselectivity of GM\textsubscript{3} synthesized was greatly increased (78\%, \(\alpha\) anomer only).\textsuperscript{201b} However, the introduction and removal of the auxiliary group necessitated additional steps. This therefore limit the efficiency of this approach. Using thioglycosides, Hasegawa and

\textsuperscript{199} Okamoto, K.; Goto, T. \textit{Tetrahedron} 1990, 46, 5835  
coworkers\textsuperscript{202} found DMTST to be an efficient glycosylation catalyst using thioglycoside often producing exclusively the \( \alpha \) anomers. The DMTST-catalyzed glycosylation reaction of methyl thioglycosyl donor \textbf{4.3} and lactosyl acceptor \textbf{4.7} afforded 47\% yield of \textbf{GM}_3. Schmidt’s group\textsuperscript{203} has demonstrated the utility of sialyl dialkyl phosphites as glycosyl donors. Glycosylation of lactosyl acceptor \textbf{4.6} with dialkyl phosphite glycosyl donor \textbf{4.4} using TMSOTf as catalyst gave \textbf{GM}_3 trisaccharide in 55\% yield. Another successful example as shown from the work of Lönn and Stenvall,\textsuperscript{204} the AgOTf-MSB catalyzed glycosidation of sialyl-S-glycosyl xanthate \textbf{4.5} and lactosyl acceptor \textbf{4.8} afforded \textbf{GM}_3 in 63\% yield.

Though tremendous progress has been made in terms of glycosylation reactions between sialyl donors and lactosyl acceptors, all of those involving \textbf{GM}_3 trisaccharides (table \textbf{4.1}) have the anomic center of the glucosyl moiety blocked as O-ether groups. Hence, further transformations of \textbf{GM}_3 trisaccharide into biologically important glycoconjugates need deblocking reactions at the anomic centers and transformations of the reducing trisaccharides into activated glycosyl donors such as 1-O-acyls, 1-halides or 1-trichloroacetimidates.\textsuperscript{205} Activation at the anomic position from directly blocked trisaccharide, is highly desirable. This could be achieved using our “active-latent” glycosylation strategy. The synthesis of \textbf{GM}_3 trisaccharide unit can be achieved by glycosylation reaction between an “active” glycosyl donor and a “latent” glycosyl acceptor in the presence of thiophilic promoter (NIS/TfOH). Both the “active” sialyl donors and the “latent” lactosyl acceptors could be prepared from the corresponding glycosyl halides under PTC conditions as we discussed in chapter 2. The synthetic strategy toward \textbf{GM}_3 and related gangliosides is illustrated in scheme \textbf{4.1}.

The remarkable character of the sialosides obtained from our "active-latent" glycosylation method is that these "latent" oligosaccharides can be transformed into an "active" donor by a mild reduction-acetylation method in almost quantitative yield. The new "active" oligosaccharide donors are very useful in further block synthesis of oligosaccharides and glycoconjugates. The S-linkage between the GM₃ moiety and aglycon instead of the usual O-linked forms seen in natural GM₃ increases the stability of GM₃ glycoconjugates toward the hydrolysis by glucohydrolases.

Scheme 4.1 General Strategy for the Synthesis of GM₃ and Related Sialosides
4.2 Results and Discussion

4.2.1 Synthesis of Neu5Ac-α-(2→6)-β-D-Galactoside

For the initial attempts to evaluate the feasibility of the “active-latent” glycosylation strategy toward the synthesis of GM₃ and GM₂-related sialosides, we set out to synthesize Neu5Ac-α-(2→6)-β-D-Gal disaccharide as a model reaction for studying suitable glycosylation conditions (Scheme 4.2).⁶⁶

Scheme 4.2 Synthesis of Neu5Ac-α-(2→6)-β-D-Gal Disaccharide

The active sialosyl donor 101 was prepared from β-acetochloroneuramnic acid 4 and para-methoxythiophenol under PTC conditions described in Chapter 2. The latent glycosyl acceptor 64 has already been described in Chapter 3. In the glycosylation reactions, we chose propionitrile as solvent to form glycosyl nitrilium ions as
intermediates\textsuperscript{206} in order to influence the configuration of the newly introduced anomic center. To increase the $\alpha$-stereoselectivity and to reduce the amount of 2,3-elimination product of Neu5Ac 103,\textsuperscript{207} a lower glycosylation reaction temperature was preferred.

Glycosylation of "active" (reactive) para-methoxylphenyl thiosialoside 101 with "latent" (temporary inactive) para-nitrophenyl 2,3,4-tri-O-benzoyl-1-thio-$\alpha$-D-galactopyranoside 64 in propionitrile using N-iodosuccinimide (NIS) and triflic acid (TfOH) as promoter proceeded well at -60 °C. The resulting disaccharide 102 was obtained in good yield (52%) and $\alpha$-stereoselectivity. Elimination product of Neu5Ac 103 was obtained in 19% yield. Neither cross-coupling product, nor $\beta$-disaccharide were detected under these glycosylation conditions.

Although sialosides lack an anomic proton, the anomic configuration can be inferred on the basis of empirical rules. These rules include: (i) $\alpha$ δ H3eq > $\beta$ δ H3eq;\textsuperscript{208} (ii) $\alpha$ δ H4 < $\beta$ δ H4;\textsuperscript{209} (iii) $\alpha$ J\textsubscript{7,8} > $\beta$ J\textsubscript{7,8}.\textsuperscript{210} Another NMR method for determination of the anomic configuration was based on coupling constants. In the $\text{C}_\text{5}$ chair conformation, the $^3$J\textsubscript{Cl,H3a} of the $\alpha$-anomer is larger than that of the $\beta$-anomer.\textsuperscript{211} Accordingly, the $\alpha$-configuration of C-2' of disaccharide 102 was confirmed by $^1$H- and $^{13}$C-NMR spectra which showed H-3e at δ 2.46 ppm (J\textsubscript{3e,3′} = 4.6, J\textsubscript{3e,3a} = 12.9 Hz) and C-1' at δ 165.1 ppm ($^3$J\textsubscript{Cl,H3a} = 6.3 Hz).

The high stereoselectivity of this glycosylation reaction can be explained by the effect of nitriles as participating solvents.\textsuperscript{208} The general principle of solvent participation is shown in Scheme 4.3. A $\beta$-nitrilium ion intermediate was formed during the reaction

\textsuperscript{206} Schmidt, R. R.; Behrendt, M.; Toepfer, A. Synlett. 1990, 11, 694.

155
performed in nitrile solvents at low temperature. The β-nitrilium ion can then undergo inverse displacement at anomeric center to form the α-anomer.\(^{204,212}\)

![Chemical structures](image)

**Scheme 4.3 The Possible Mechanism of Thiophilic Promoters Mediated Sialylation**

Encouraged by these results, we also tried the direct glycosylation of "latent" galactosyl acceptor 54 with "active" sialyl donor 12. This was performed under the same conditions described above for 104. Despite a large number of attempts, a complex reaction mixture was obtained, including 2,3-elimination product 103. The crude NMR spectrum of the mixture did not show the presence of disaccharide 104. The use of 6-O-benzoylated galactose 71 as the "latent" acceptor proved equally frustrating. These results could possibly be explained by the partial activation of glycosyl acceptors 54 and 71 by the thiophilic promoter. Since "latent" glycosyl acceptors 54 and 71 are not deactivated by benzoyl groups as in acceptor 64, they might not be completely inert under these

\(^{212}\) Kirchner, E.; Thiem, F.; Demick, R. *J. Carbohydr. Chem.* 1988, 7, 453.
glycosylation conditions. Self-couplings and partial decompositions of these acceptors might be possible.

Thus, further investigations need to be done to explain these results and design suitable derivatives for a direct condensation approach as described above.

Scheme 4.4 Glycosylation of "Latent" Galactosyl Acceptors

4.2.2 Selectively Protected Lactose and Lactosamine Derivatives as Building Blocks for GM₃ Sialosides

The benefit using of lightly protected acceptors, which results mostly from the lack of additional steric impediments, was already recognized by several groups.²⁰³⁻²⁰⁶,²¹³,²¹⁴ Our "active-latent" glycosylation strategy for the synthesis of the GM₃ trisaccharide and its analogues first required the preparation of lightly protected lactoside building blocks.

The starting material, para-nitrophenyl hepta-O-acetyl-1-thio-β-D-lactoside 11, was conveniently prepared on large scale using PTC methods well established in this group.\textsuperscript{55-61} Catalytic deacetylation (NaOMe, MeOH) of 11 afforded quantitatively para-nitrophenyl 1-thio-β-D-lactoside 106. Treatment of 106 with 2,2-dimethoxypropane in the presence of p-toluene sulfonic acid gave para-nitrophenyl O-(3,4-O-isopropylidene-β-D-galactopyranosyl)-(1→4)-1-thio-β-D-glucopyranoside 107 in 80% yield. A sizable amount of isomeric and thermodynamically unstable 4′,6′-O-isopropylidene acetal\textsuperscript{215} was also detected in the reaction mixture by thin-layer chromatography (Rf 0.72, 8:1, chloroform-methanol) and could be converted to the thermodynamically stable 3′,4′-O-isopropylidene acetal 107 by boiling the product mixture in methanol-water 10:1 for 2 hours. The position of the isopropylidene acetal in 107 was verified by NMR spectroscopy. The signal in the \textsuperscript{13}C NMR spectrum at δ 27.6, 26.2 and 111.4 clearly indicated the presence of a five-membered isopropylidene structure fused to pyranoside ring.\textsuperscript{216}

Sequential benzylation of 107 using benzyol chloride (large excess) in pyridine and deacetylation under acidic conditions (cat. p-TsOH) gave para-nitrophenyl O-(2,6-di-O-benzyol-1-thio-β-D-galactopyranosyl)-(1→4)-2,3,6-tri-O-benzyol-β-D-glucopyranoside 124 were straightforward and efficient (Scheme 4.5). However, initial attempt of regioselective benzylation at 2-, 6-, 6′-OH groups of lactoside 107 gave mixtures of di-, tri- and tetra-benzyolated products. Despite a large number of attempts to improve the regioselectivity by changing the reaction temperatures and the pyridine-dichloromethane solvent system, no dramatical improvements were observed. Under optimized reaction conditions, i.e. using pyridine-dichloromethane (1:1 in v/v) as solvent and low reaction temperatures (-50°C), the desired 2,6,6′-tri-O-benzyolated derivative 69 was obtained in 31% yield together with four other partially benzyolated products (Table 4.2). In addition, the separation of the five partially benzyolated lactosides, especially those tri-O-benzyolated regioisomers 109-111, was very difficult. Obviously, this synthetic route was not practical for preparative synthesis.

\(^a\) Isolated compounds.
Alternatively, regioselective benzylation of lactoside 107 via stannylene intermediate formation\textsuperscript{217} proved to be very efficient. In fact, treatment of para-nitrophenyl 3,4-O-isopropylidene $\beta$-D-lactoside derivative 107 in boiling toluene with 6 equiv. of stannylation reagent $(\text{Bu}_3\text{Sn})_2\text{O}$ for 23 h and subsequent treatment with benzoyl chloride (6 equiv.) for an additional 24 h at 45 °C afforded the desired para-nitrophenyl 2,6,6'-tri-O-benzoylated $\beta$-D-lactoside derivative 109 in 74% yield together with 6% of di-O-benzoylated derivative 108 and 3% of tetra-O-benzoylated derivative 98. Very interestingly, under this stannylation reagent mediated regioselective benzylation reaction, the other two tri-O-benzoylated regioisomer 110 and 111 were not detected.

In the process of characterization of partially benzyolated derivatives 98, 109-111 and 112, we found that $^1$H-NMR data (Table 4.3), particularly the data of H-2, H-3 and H-2', are very informative. Benzoyl groups showed a strong deshielding effect. A $\Delta \delta = +1.5$ ppm downshifted C-H signal were usually observed at the benzyolated position compared with that of unbenzyolated counterpart. All the partially benzyolated compounds 98, 108-111 and 112 showed downshifted H-6 and H-6' signals at $\delta$ 4.5-4.8 ppm, therefore the two benzyolated groups must be at positions -6 and -6' of 98, 108-111. Three tribenzoylated regioisomers 109, 110 and 111 could be unambiguously assigned from the H-2, H-3 and H-2' signals in the $^1$H-NMR spectra. As we see from table 4.3, 2, 6, 6'-tri-O-benzoylated regioisomer 109 showed a downshifted H-2 signal of its at $\delta$ 5.26 ppm, the 3, 6, 6'-tri-O-benzoylated regioisomer 110 showed a downshifted H-3 signal of its at $\delta$ 5.44 ppm and the 2', 6, 6'-tri-O-benzoylated regioisomer 111 showed its H-2' signal downshifted at $\delta$ 5.33 ppm. Tetra-O-benzoylated compound 98 showed two shifted downfield signals at $\delta$ 5.19 and 5.35 for H-2 and H-2' respectively. From these regioselective benzyolation experiments, we found that the order of benzoylation of the five hydroxyl groups of 3',4'-O-isopropylidene-$\beta$-D-lactoside 107 was derivatives is HO-6 $\sim$ HO-6' $>$ HO-2 $>$ HO-2' $>$ HO-3. In the mass spectra, all three regioisomers 109, 110 and 111 showed common positive-ion at m/z 832.3 due to (M+1)$^+$.

while di- and tetra-O-benzoylated lactosides 108 and 98 showed (M+1)<sup>*</sup> peaks at m/z 728.3 and 936.3 respectively.

a: Recorded on a Bruker AMX-500 MHz spectrometer at ambient temperature.
b: Assignment are based on COSY and TOCSY experiments. Chemical shifts are referenced to internal CHCl₃ at 7.24 ppm and are given in ppm and spin-spin coupling constants appear in parentheses.

The last step in the preparation of lightly protected lactosyl acceptors consists in the deprotection of the isopropylidene groups. The isopropylidene groups in tribenzoylated lactoside 109 and tetrabenzoylated lactoside 112 could be removed quantitatively by refluxing in methanol in the presence of p-toluenesulfonic acid as catalyst. This procedure gave lightly protected lactosyl acceptors 113 and 114. The 2',3',4'-OH free on lactosyl acceptor 113 allow selective 3'-O-α-sialylation with sialyl donor 12 to produce GM₃ trisaccharide.

Tetrabenzoxyld lactosyl acceptor 98 was suitable for fucosylation at position-3' to produce the corresponding Le^+ analogue 99 as described in section 3.4.

![Chemical structures](image)

Scheme 4.6 Selective Protection of Lactoside 106 and Lactosaminide 115

Alternatively, two other very concise synthetic routes outlined in Scheme 4.6 were devised to prepare lactosyl building blocks. In the first approach, para-nitrophenyl thiolactoside 106 and N-acetyllactosamine derivative 115 were used as starting compounds. In the first approach, treatment of 106 and 115 with tert-butyldiphenylsilyl chloride (TBDPSCI) in dry pyridine at room temperature for 6-8 hours afforded 6,6'-di-O-silylated derivatives 116 and 119. It is worthy to mention that evaporation of dry pyridine from the starting materials 2-3 times prior to the addition of the silylating reagent (TBDPSCI) resulted in significant improvement of yields (~90%) of silylated lactoside derivatives 116 and 119.
In the second approach, treatment of lactoside derivatives 106 and 115 with benzaldehyde dimethylacetal in dry acetonitrile using p-toluenesulfonic acid as catalyst gave the 4',6'-O-benzylidene derivatives 117 and 120 in 93% and 89% yield respectively.

4.2.3 Regio- and α-Stereoselective Glycosylation of Sialic Acid-Synthesis GM₃-trisaccharide and GM₃ analogs

Having prepared the key glycosyl acceptors, a crucial coupling of thiosialoside 12 (1.5 equivalents) with glycosyl acceptor 113 was performed in the presence of the N-iodosuccinimide (NIS) and triflic acid (TfOH) in dry propionitrile at -60°C to give the expected α-glycoside 122 of Neu5Ac in 47% yield (Scheme 4.7).

![Scheme 4.7 Synthesis of GM₃ Trisaccharide](image)

Again, the 2,3-elimination product of Neu5Ac (103) was isolated in 15% yield as a by-product of the reaction. Neither self-coupling product of acceptor 113 nor β-trisaccharide were detected under this glycosylation conditions. The reaction showed
remarkable α-stereoselectivity in accordance with previous experiments from section 4.2.1. Similar results were obtained using acetonitrile and methylene chloride mixture as solvent. Molecular sieves (4 Å) were added to ensure strict anhydrous and neutral conditions.\(^{145}\) It should be noted that the amount of triflic acid required for the glycosylation reaction depended on both the intrinsic reactivity of the glycosyl donors and the amount of molecular sieves added to the glycosylation reactions. Due to electron withdrawing character\(^{221}\) of the carboxylic acid function at C-2, the “active” thiophenyl donor 12 became “less-active” compared to other phenyl thioglycosyl donors that were discussed in Chapter 3. Careful control of the amount of triflic acid used in the sialylation reaction and the selective activation of the phenyl thiosialyl donor in the presence of para-nitrophenyl thiolactosyl acceptor were crucial for the successful synthesis of the \(\text{GM}_3\) trisaccharide unit.

The structure of 122 was assigned as follows. The α-configuration at C-2 in 122 was readily assigned from the \(^1H\)-NMR spectrum which contained a deshielded doublet for H-3e at \(\delta\) 2.69 ppm (J\(_{3e''-4''}\) = 4.6, J\(_{3e''-3a''}\) = 12.9 Hz) and from the \(^1^3\)C-NMR spectrum at \(\delta\) 168.1 ppm (C-1\(^\prime\), J\(_{C-1'-3\alpha''}\) = 4.2 Hz). The regioselectivity for the newly introduced interglycosidic linkage in 122 was determined by its \(^1H\)-NMR spectrum. The H-3\(^\prime\) signal in 122 was shifted downfield from 3.66 to 4.16 ppm upon sialylation and the anomeric carbon (C"-'2) of sialic acid was shifted downfield from 87.5 to 97.5 ppm by substituting the anomeric sulfur atom to oxygen respectively. The mass spectrum of 122 gave M\(^+\) peak at 1265.3.

Further derivatization of 122 was considered in order to prepare sialyl Le\(^\alpha\) as shown in Scheme 4.8. The trisaccharide acceptor 122 was first coupled with methyl 2,3,4-tri-O-benzyl-1-thio-β-L-fucopyranoside\(^{43}\) 93 in the presence of NIS/TfOH in dichloromethane at -70 °C to give sialylated tetrasaccharide 123 in 63% yield together with recovered trisaccharide acceptor 122 (17%) and a minor unidentified regioisomer (less than 10% as judged by TLC. This result was in accordance with our previous observations (Section 4.3.2) for the reactivity of the 2\(^\prime\)-OH over that of 3-OH in β-D-lactoside.
The α-configuration of the newly introduced anomic center of 123 was determined from the $^1$H-NMR spectrum which showed a signal for H-1 (fucosyl moiety) at δ 5.58 ppm ($^3$J$_{1,2}$ = 4.1 Hz). The regiochemistry of the newly introduced interglycosidic linkage in 122 was determined by its $^{13}$C-NMR spectrum. The C-2' signal in 123 was shifted downfield from 68.7 to 74.3 ppm upon fucosylation. The mass spectrum of 123 gave a M$^+$ peak at 1681.3 and [M-HSPHNO$_3$]$^+$ peak at 1425.3 respectively.

![Chemical structures](image)

Scheme 4.8 Fucosylation of GM$_3$-Synthesis Sialyl Le$^x$ Regioisomer

The glycosylation of 119 with phenyl thiosialoside 12 (1.7 equivalents) in propionitrile for 50 min at -60 °C in the presence of NIS/TfOH (2:1 equivalent relative to acceptor) gave the expected α-sialoside 124 in 46% yield, together with the 2,3-dehydro derivative 103 isolated in 17% yield as a by-product (Scheme 4.9). No β-glycoside of
Neu5Ac was isolated. The observed chemical shifts and coupling constants (δ 2.69 ppm, J₃₃₋₄₋ 12.0 Hz, J₃₋₄ 4.5 Hz, δ 4.92 ppm, J₄₋₅⁻ 10.0 Hz; δ 5.27 ppm, J₅₋₆⁻ 8.7 Hz) for H-3e, H-4", and H-7" in the Neu5Ac moiety are characteristic of α sialoside linkage. Other ¹H-NMR data (see experimental section) are consistent with the structure 124.

Scheme 4.9 Synthesis of Neu5Acc(2,3)βGal(1,4)βGlcNAc Trisaccharide

4.3 Conclusion

In conclusion, our “active-latent” glycosylation strategy was successfully extended to the synthesis of NeuAc-containing glycosides. Selective activation of “active” α-thiosialosides of Neu5Ac over “latent” para-nitrophenyl thioglycosyl acceptors in the presence of NIS/TIOH promoter was possible. The facile regio- and α-stereo-selective glycosidation of Neu5Ac with several glycosyl acceptors was achieved using thiophilic promoter in propionitrile under kinetically controlled conditions. By using the “active-latent” thioglycosylation strategy, GM₃ trisaccharide and GM₃ related sialosides have been synthesized in good yield.
A striking merit of the sialosides prepared using the "active-latent" strategy was that the "latent" glycosides could be directly activated through the simple two-step conversion of the anomeric EWG (NO$_2$) to EDG (NHAc) as discussed in the third chapter. The versatile chemistry used to make them is very useful in the building of more complex oligosaccharides and glycoconjugates. Furthermore, the versatile transformations of the $p$-nitrophenylthio groups into $p$-acrylamidophenylthio groups and the usefulness of the $p$-acrylamidophenylthio groups for the synthesis of glycopolymers can serve other applications. The latter topic will be elaborated in the next chapter.

4.4 Experimental

Para-Nitrophenyl O-(methyl 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosylonate)-(2→6)-2,3,4-tri-O-benzoyl-1-thio-α-D-galactopyranoside 102

To a solution of para-methoxyphenyl (methyl 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-2-thio-D-glycero-α-D-galacto-2-nonulopyranosid) onate 101 (58.5 mg, 95.4 μmol), glycosyl acceptor 64 (50 mg, 79.5 mmol) in dry propionitrile (3 mL) was added molecular sieves (4 Å, 100 mg). The mixture was stirred 4 hours at room temperature and then cooled to -60°C. N-Iodosuccinimide (43 mg, 191 μmol) and trifluoromethanesulfonic acid (5.9 μL, 66.8 μmol) were then added. The solution was stirred for 45 min at -60°C. The progress of the reaction was monitored by TLC using a mixture of benzene/acetone (3:2, v/v) as eluent. The reaction mixture was diluted with CH$_2$Cl$_2$ (5 mL) and filtered through a pad of Celite. The filtrate was successively washed with 10% aqueous thiosulfate, saturated aqueous sodium bicarbonate and brine. The organic phase was dried (Na$_2$SO$_4$) and concentrated under reduced pressure. The crude residue was purified by silica gel chromatography using 3% ethanol in dichloromethane as eluent. Disaccharide 102 was obtained (44.8 mg) in 52% yield: m.p. 117.4-118.5 °C; [α]$_D$ +45.2° (c = 1.1, CHCl$_3$); FAB-MS (glycerol) gave m/z (ion, relative intensity): 1086.2 ([M]$^+$, 0.3 %),

Para-Nitrophenyl O-(β-D-galactopyranosyl)-(1→4)-1-thio-β-D-glucopyranoside 106

Para-nitrophenyl O-(2,3,4,6-tera-O-acetyl-β-D-galactopyranosyl)-(1→4)-O-2,3,6-
tri-O-acetyl-1-thio-β-D-glucopyranoside 11 (15 g, 2.8 mmol) was suspended in 150 mL
methanol to which was added 1.25 mL of sodium methoxide (1M). The reaction mixture
was stirred at room temperature for 1.5 hours, after which time solution turned clear. TLC
(methanol/dichloromethane 3:5) showed that a clean and complete conversion of the
starting material (RF = 0.95) to product 106 (RF = 0.15) had occurred. The reaction
mixture was concentrated under reduced pressure to 50 mL. Crystalline product
precipitated out as fine needles, which were filtered to provide 106 as a first crop product
(6.7 g). The filtrate was concentrated and a second crop of product (1.8 g) was obtained.
Total 8.5 g of 106 was obtained in quantitative yield: m.p. 222-224 °C; [α]D -56.0° (c =
1.0, DMSO); IR (Thin film, \( \nu_{\text{cm}^{-1}} \)): 3318, 2907, 1595, 1579, 1511, 1459, 1376, 1342, 1131, 1079, 854, 739; FAB-MS (glycerol) gave m/z (ion, relative intensity): 480.3 ([M+1]^+ , 3.6%), 325.1 ([M+1-HSPhNO₂]^+ 6.7%); \(^1\)H-NMR (D₂O) \( \delta \) (ppm): 8.20 (d, 2H, \( J_{o.m} = 9.1 \) Hz, H-meta), 7.66 (d, 1H, H-ortho), 5.10 (d, 1H, \( J_{1,2} = 9.9 \) Hz, H-1), 4.47 (d, 1H, \( J_{1,2'} = 7.5 \) Hz, H-1'), 4.38-3.35 (m, 12H, H-2-H-6b, H-2'-H-6b'); \(^{13}\)C-NMR (DMSO) \( \delta \) (ppm): 145.7 (C-ipso), 143.2 (C-para), 126.8 (C-meta), 124.6 (C-ortho), 103.8 (C-1'), 84.6 (C-1), 79.9 (C-4), 78.9 (C-3'), 76.3 (C-5), 75.6 (C-5'), 73.3 (C-2'), 72.3 (C-3'), 70.6 (C-2), 68.2 (C-4'), 64.5 (C-6), 60.2 (C-6').

Para-nitrophenyl O-(3,4-O-isopropylidene-\( \beta \)-D-galactopyranosyl)-(1\( \rightarrow \)4)-1-thio-\( \beta \)-D glucopyranoside 107

Para-nitrophenyl thiogalactopyranoside 106 (2.0 g, 4.17 mmol) was suspended in 2,2-dimethoxypropane (100 mL). A catalytic amount of p-toluenesulfonic acid was added and the reaction mixture was then heated under reflux for 15 minutes. TLC (chloroform-methanol 8:1) showed two products (R₁ = 0.72, R₂ = 0.61) and no starting material. Triethylamine was added until the pH becomes slightly basic. Evaporation of the solution gave a residue which was dissolved in methanol-water 10:1 (100 mL) and boiled under reflux until TLC showed complete disappearance of the compound of R₁ = 0.72 (2 hours). The mixture was concentrated and toluene (3x20 mL) was evaporated from the residue. The crude product was purified by silica gel chromatography (5% methanol/dichloromethane) affording 107 (1.73 g) in 80% yield: m.p. 175-176 °C; \([\alpha]_{D}^{22} -32^\circ\) (c = 1.0, DMSO); IR (Thin film, \( \nu_{\text{cm}^{-1}} \)): 3395 (br, OH), 2909, 1580, 1516, 1341, 1220, 1063, 853, 743; FAB-MS (glycerol) gave m/z (ion, relative intensity): 519.5 ([M+1]^+, 1.8%); \(^1\)H-NMR (500 MHz, acetone-d6) \( \delta \) (ppm): 8.13-7.31 (m, 14 H, Aromatic H), 8.14 (d, 2H, \( J_{o.m} = 9.0 \) Hz, H-meta), 7.69 (d, 2H, H-ortho), 5.04 (d, 1H, \( J_{1,2} = 9.9 \) Hz, H-1), 4.44 (d, 1H, \( J_{1,2'} = 8.2 \) Hz, H-1'), 4.26-3.21 (m, 12 H, H-2-H-6, H-2'-H-6'); \(^{13}\)C-NMR (125.7 MHz, acetone-d6) \( \delta \) (ppm): 146.7 (C-para of SPhNO₂), 146.4 (C-ipso of
SPhNO₂), 129.5 (C-meta of SPhNO₂), 124.5 (ortho of SPhNO₂), 110.1 (O-C-O), 104.3 (C-1'), 86.2 (C-1), 81.8, 80.7, 80.6, 80.0, 75.0, 74.5, 74.1, 74.0, 62.3 (C-6'), 63.8 (C-6), 28.4, 26.5 (2xCH₃); ¹³C-NMR (DMSO-d₆) δ (ppm): 146.8 (C-para of SPhNO₂), 146.1 (C-ipso of SPhNO₂), 128.0 (C-meta of SPhNO₂), 124.9 (ortho of SPhNO₂), 109.8 (O-C-O), 103.8 (C-1'), 85.7 (C-1), 80.8, 80.4, 79.9, 77.3, 74.5, 74.3, 73.6, 73.4, 61.6, 61.0, 29.3, 27.4 (2xCH₃).

Anal. Calcd for C₂₁H₂₉O₁₂NSCH₃OH (549.53): C, 47.91; H, 6.03; N, 2.54, S, 5.81. Found: C, 47.90; H, 5.68; N, 2.46; S, 5.81.

Para-nitrophenyl O-(2,6-di-O-benzoyl-3,4-O-isopropylidene-β-D-galactopyranosyl)-(1→4)-2,3,6-tri-O-benzoyl-1-thio-β-D-glucopyranoside 112

3', 4'-O-Isopropylidene-β-lactoside 107 (500 mg, 0.481 mmol) was dissolved in 10 mL of dry pyridine, the solution was cooled to 0°C and benzoyl chloride (844 µL) was added. The mixture was then allowed to reach room temperature and was stirred overnight. TLC (1:9, CH₃OH-CH₂Cl₂) showed complete conversion of the starting material 107 (Rf = 0.08) to product 112 (Rf = 0.68). The reaction mixture was poured onto ice water and extracted with CH₂Cl₂ (3x20 mL). The combined extracts were washed successively with saturated sodium bicarbonate, saturated sodium chloride and water. The solution was dried (Na₂SO₄) and concentrated to a foam that was chromatographed on silica gel (3:5, ethyl acetate/hexane, 5% ethanol in dichloromethane) to afford lactoside 112 (647 mg) in 92% yield: m.p. 254-255 ºC; [α]D +4.7º (c = 1.0, CHCl₃); IR (Thin film, ν cm⁻¹): 3055, 2931, 1726, 1719, 1599, 1549, 1515, 1450, 1342, 1265, 1093, 842, 708; FAB-MS (glycerol) gave m/z (ion, relative intensity): 1040 ([M+1]+, 0.2%), 885.3 ([M+1-HSPhNO₂]+, 1.9%); ¹H-NMR (CDCl₃) δ (ppm): 8.03-7.35 (m, 29H, aromatic H), 5.76 (dd, 1H, J₃,₄ = 8.8 Hz, H-3), 5.40 (dd, 1H, J₂,₃ = 9.7 Hz, H-2), 5.13 (dd, 1H, J₉,₈ = 6.8 Hz, H-9'), 4.96 (d, 1H, J₁,₂ = 9.7 Hz, H-1), 4.68 (dd, 1H, J₅,₆α = 1.6, J₆α,₆β = 11.8 Hz, H-6α), 4.61 (d, 1H, J₁,₂' = 7.7 Hz, H-1'), 4.46 (dd, 1H, J₅,₆β = 5.2 Hz, H-6β), 4.29-3.92 (m, 5H, H-3', H-4, H-4', H₅', H-6α'), 3.88 (ddd, 1H, H-5), 3.73 (dd, 1H, J₉',₆α = 7.1, J₆α',₆β', etc.)
Para-nitrophenyl O-(2,6-di-O-benzoyl-α-D-galactopyranosyl)-(1→4)-2,3,6-tri-O-benzoyl-1-thio-β-D glucopyranoside 114

To a solution of lactoside 112 (500 mg, 0.481 mmol) dissolved in 15 mL of a 1:1 mixture of CH₂Cl₂ and CH₃OH was added p-toluenesulfonic acid (100 mg). The mixture was stirred at 40°C for 2 hours. TLC (5% t-BuOH in CH₂Cl₂, v/v) showed complete conversion of 112 (Rf = 0.51) into lactoside 114 (Rf = 0.45). The reaction mixture was neutralized with triethylamine and concentrated under reduced pressure. The residue was purified by silica gel chromatography to afford 114 (440 mg) in 92% yield: m.p. 178-180°C; [α]D +11.8° (c =1.0, CHCl₃); IR (Thin film, cm⁻¹): 3446, 3066, 2932, 1728, 1741, 1600, 1582, 1517, 1451, 1341, 1316, 1270, 1178, 1097, 1028, 848, 742, 710; FAB-MS (glycerol) gave m/z (ion, relative intensity): 1000.3 ([M+1]⁺, 0.3%), 845.3 ([M+1-HSPhNO₂]⁺, 3.9%), 724.3 ([845.3-PHCO₂H]⁺, 1.0%); ¹H-NMR (500 MHz, CDCl₃) δ (ppm): 8.01-7.27 (m, 29H, Aromatic H), 5.72 (dd, 1H, J₃,₄ = 9.2 Hz, H-3), 5.41 (dd, 1H, J₂,₃ = 9.7 Hz, H-2), 5.31 (dd, 1H, J₂,₂' = 7.7 Hz, H-2'), 4.97 (d, 1H, J₁,₂ = 9.9 Hz, H-1), 4.65 (dd, 1H, J₆,₆' = 12.1 Hz, H-6a), 4.62 (d, 1H, J₁',₂' = 7.8 Hz, H-1'), 4.51 (dd, 1H, J₃,₆b = 5.9 Hz, H-6b), 4.05 (dd, 1H, J₄,₅ = 9.8 Hz, H-4), 4.02 (dd, 1H, J₆a,₆b = 11.3 Hz, H-6a'), 3.96 (dd, 1H, J₅,₆a = 1.8 Hz, H-5), 3.84 (dd, 1H, J₄',₅' < 1.0 Hz, H-4'), 3.73 (dd, 1H, J₃',₄' = 3.4 Hz, H-3'), 3.64 (dd, 1H, J₅',₆a = 6.5 Hz, H-6b'), 3.65 (dd, 1H, J₃',₆b = 6.4 Hz, H-5'); ¹³C-NMR (125.8 MHz, CDCl₃) δ (ppm): 166.4, 166.1, 165.7, 165.7, 165.2, (5x C=O), 146.8 (C-para of SPhNO₂), 141.66 (C-ipso of SPhNO₂), 133.7-123.7 (24C, aromatic C), 100.9 (C-1'), 84.1 (C-1), 77.4 (C-5), 76.1 (C-4), 73.8 (C-3), 73.7 (C-2'), 72.7 (C-5'), 72.6 (C-3'), 70.1 (C-2), 68.5 (C-4), 62.7 (C-6), 61.9 (C-6').
Anal. Calcd for C_{33}H_{45}O_{17}N_{4}S_{1}: C, 63.66; H, 4.54; N, 1.40. Found: C, 63.11; H, 4.68; N, 1.30.

**Regioselective Benzoylation**

**Method A**

The 3',4'-O-isopropylidene β-D-lactoside derivative 107 (1.39 g, 2.68 mmol) was dissolved in 4:1 mixture (16 mL) of pyridine and CH₂Cl₂. The solution was cooled to -50°C. To this cooled solution was slowly added 1.41 mL (4.5 equiv.) of benzoyl chloride dissolved in 9 mL CH₂Cl₂. The reaction mixture was kept stirring at -50°C for 1 hour. TLC (5:4 ethyl acetate/hexane) indicated that no starting material was left. Work up was done as standard procedure. The benzylated products were separated by silica gel chromatography using 3:7 ethyl acetate/hexane and 3% ethanol in methylene chloride respectively. Five benzylated products were separated as: 2, 2', 6, 6'-tetra-O-benzoylated lactoside 98 (456 mg) in 19% yield, 6,6'-di-O-benzoylated lactoside 108 (325 mg) in 17% yield, 2, 6, 6'-tri-O-benzoylated lactoside 109 (675 mg) in 31% yield, 3, 6, 6'-tri-O-benzoylated lactoside 110 (173 mg) in 8% yield, 2', 6, 6'-tri-O-benzoylated lactoside 111 (251 mg) in 12% yield.

**Method B**

The 3',4'-O-isopropylidene β-D-lactoside derivative 107 (900 mg, 1.73 mmol) was dissolved in 50 mL of dry toluene and 2.85 mL of (Bu₂Sn)₂O was added. The reaction mixture heated under reflux with stirring for 23 hours. The reaction mixture was cooled to room temperature. Benzoyl chloride (1.2 mL, 10.38 mmol, 6 eq) and pyridine (5 mL) were added and the reaction temperature was raised to 45°C with stirring for an additional 24 hours. TLC (8% acetone/chloroform) showed that the starting material (R₉ = 0.06) was completely consumed and compound 109 (R₉ = 0.34) was obtained as a major product. After usual work-up, the crude mixture of products was chromatographed on silica gel (1:12 acetone/chloroform) to afford compound 109 (1.07 g), 98 (155 mg), and 108 (38 mg) in 74%, 6%, and 3% yield respectively.
Para-Nitrophenyl O-(2,6-di-O-benzoyl-3,4-O-isopropyldene-β-D-galactopyranosyl)-(1→4)-2,6-di-O-benzoyl-1-thio-β-D-glucopyranoside 98

Compound 98 had: m.p. 233-234 °C; [α]D = -14.1° (c =1.0, CHCl3); IR (Thin film, v cm⁻¹): 3457, 3067, 2987, 1725, 1600, 1516, 1451, 1341, 1268, 1110, 1070, 853, 709; FAB-MS (glycerol) gave m/z (ion, relative intensity): 936.3 ([M+1]⁺, 1.8%), 781.3 ([M+1-HSPHNO₂]⁺, 3.3%); ¹H-NMR (500 MHz, CDCl₃) δ (ppm): 8.09-7.23 (m, 24 H, Aromatic H), 5.35 (dd, 1H, J₂,3 = 7.8 Hz, H-2'), 5.19 (dd, 1H, J₂,3 = 9.2 Hz, H-2'), 4.87 (d, 1H, J₁,₂ = 10.0 Hz, H-1), 4.85 (dd, 1H, J₅,₆a = 2.5, J₆a,₆b = 12.5 Hz, H-6a'), 4.65 (d, 1H, J₁,₂ = 8.2 Hz, H-1'), 4.43 (dd, 1H, J₅,₆a = 1.8, J₆a,₆b = 11.9 Hz, H-6a), 4.42 (m, 1H, H-6b'), 4.41 (dd, 1H, J₃,₄,= 5.3 Hz, H-3'), 4.29-4.25 (m, 2H, H-4', H-5'), 4.22 (dd, 1H, J₅,₆b = 5.3 Hz, H-6b), 4.02 (dd, 1H, J₃,₄ = 8.4 Hz, H-3), 3.80 (dd, 1H, J₅,₆b = 5.4 Hz, H-5'), 3.65 (dd, 1H, J₄,₅ = 9.8 Hz, H-4); ¹³C-NMR (125.7 MHz) δ (CDCl₃): 165.5, 165.4, 165.3, (3x C=O), 146.7 (C-para of SPhNO₂), 141.7 (C-ips of SPhNO₂), 133.7-123.55 (30C, aromatic), 111.4 (O-C-O), 101.6 (C-1'), 83.9 (C-1), 82.1 (C-4), 76.2 (C-3'), 74.7 (C-5), 73.4 (C-3'), 73.1 (C-2'), 72.3 (C-4', C-5'), 71.2 (C-2), 63.6 (C-6'), 62.5 (C-6), 27.6, 26.7 (2xCH₃).

Para-Nitrophenyl O-(6-O-benzoyl-3,4-O-isopropyldene-β-D-galactopyranosyl)-(1→4)-6-O-benzoyl-1-thio-β-D-glucopyranoside 108

Compound 108 had m.p. 157-158 °C; [α]D -33.7° (c = 0.86, CHCl₃); IR (Thin film, v cm⁻¹): 3444 (br, OH), 3068, 2987, 2919, 1717, 1598, 1600, 1581, 1515, 1451, 1340, 1275, 1165, 1113, 1072, 1032, 853, 754, 713; FAB-MS (glycerol) gave m/z (ion, relative intensity): 728.27 ([M+1]⁺, 4.8 %), 573.27 ([M+1-HSPHNO₂]⁺, 6.1 %); ¹H-NMR (CDCl₃) δ (ppm): 8.13-7.31 (m, 14 H, aromatic H), 4.98 (dd, 1H, J₅,₆a = 0.8, J₆a,₆b = 12.7 Hz, H-6a'), 4.78 (d, 1H, J₁,₂ = 9.7 Hz, H-1), 4.74 (dd, 1H, J₃,₄ = 2.8 Hz, H-6a), 4.34 (d, 1H, J₁,₂ = 8.4 Hz, H-1'), 4.56-3.45 (m, 28H, H-6'), 1.57, 1.38 (s, 6H, 2xCH₃); ¹³C-NMR (CDCl₃) δ (ppm): 166.5, 166.4 (CO, Bz), 146.3 (C-para of SPhNO₂),

175
143.1 (C-ipso of SPhNO₂), 134.8-123.8 (16C, aromatic C), 111.0 (O-C-O), 103.3 (C-1’), 85.3 (C-1), 80.6 (C-4), 78.9 (C-5), 77.3 (C-3), 77.1 (C-5’), 76.6 (C-3’), 73.2 (C-2), 72.9 (C-2’), 72.0 (C-4’), 71.9 (C-6’), 63.8 (C-6), 28.1, 26.2 (2xCH₃).

Para-Nitrophenyl O-(6-O-benzoyl-3,4-O-isopropylidene-β-D-galactopyranosyl)-(1→4)-2,6-di-O-benzoyl-1-thio-β-D-glucopyranoside 109

Compound 109 had m.p. 234-235 °C; [α]D +4.3°, [α]H₂O -34.0° (c = 1.0, CHCl₃); IR (Thin film, νcm⁻¹): 3400, 2932, 1721, 1509, 1516, 1451, 1341, 1270, 1113, 1071, 853, 711; FAB-MS (glycerol) gave m/z (ion, relative intensity): 832.30 ([M+1]⁺, 4.6 %), 677.21 ([M+1-HSPhNO₂]⁺, 10.4 %);¹H-NMR (500 MHz, CDCl₃) δ (ppm): 7.88-7.23 (m, 19H, Aromatic H), 5.26 (dd, 1H, J₂,₃ = 9.5 Hz, H-2), 4.99 (dd, 1H, J₆₆,₆₈ = 1.5, J₆₈,₆₉ = 12.1 Hz, H-6a), 4.95 (d, 1H, J₁,₂ = 10.1 Hz, H-1), 4.78 (dd, 1H, J₅,₆₆ = 2.4, J₆₆,₆₈ = 12.2 Hz, H-6a’), 4.44 (dd, 1H, J₅,₆₈ = 6.3 Hz, H-6b), 4.37 (dd, 1H, J₅,₆₇ = 6.3 Hz, H-6b’), 4.33 (d, 1H, J₁,₂,₃,₄ = 8.3 Hz, H-1’), 4.31-4.15 (m 2H, H-4’, H-5’), 4.14 (dd, 1H, J₃,₄ = 5.4 Hz, H-3’), 3.99 (dd, 1H, J₃,₄ = 8.5 Hz, H-3), 3.87 (ddd, 1H, J₁,₂ = 9.9 Hz, H-5), 3.95 (dd, 1H, J₂,₃ = 7.5 Hz, H-2’), 3.58 (dd, 1H, J₄,₅ = 9.9 Hz, H-4’);¹³C-NMR (125.7 MHz, CDCl₃) δ (ppm): 167.2 (2C), 166.0 (3x C=O), 147.3 (C-para of SPhNO₂), 143.2 (C-ipso of SPhNO₂), 134.6 - 124.3 (24C, aromatic C), 111.6 (O-C-O), 104.3 (C-1’), 84.8 (C-1), 82.9 (C-4), 79.7 (C-3’), 78.2 (C-5), 75.6 (C-3), 74.0 (C-5’), 74.0 (C-2’), 72.9 (C-4’), 71.9 (C-2), 64.5 (C-6), 64.4 (C-6’), 28.8, 26.9 (2xCH₃).

Para-Nitrophenyl O-(6-O-tert-butyldiphenylsilyl-β-D-galactopyranosyl)-(1→4)-6-O-tert-butyldimethylsilyl-1-thio-β-D-glucopyranoside 116

Compound 106 (2.0 g, 4.18 mmol) was dissolved in 50 mL dry pyridine. The solution was cooled to 0°C. Tert-butyldiphenylsilyl chloride (3.4 mL) was added dropwise over a period of 15 min. The reaction mixture was stirred at room temperature for 6 hours. TLC (MeOH/CH₂Cl₂, 1:10 v/v) indicated that the starting material was completely converted to product 116 (Rf = 0.43). The reaction mixture was concentrated directly under reduced pressure. Column chromatography (MeOH/CH₂CH₂, 1:15 in v/v) of the residue on silica gel (150 g) gave the titled product (3.75 g) in 90% yield: m.p. 105.7-158.0 °C; [α]D -68.8° (c = 1.0, CHCl₃); IR (Thin film, ν cm⁻¹): 3416, 3064, 2928, 2856, 1585, 1517, 1458, 1340, 1112, 1078, 747, 704; FAB-MS (glycerol) gave m/z (ion, relative intensity): 956.23 ([M+1]+, 2.2 %), 801.38 ([M+1-HSPhNO₂]+, 6.8 %); ¹H-NMR (CDCl₃) δ (ppm): 8.01-7.28 (m, 24 H, aromatic H), 4.74 (d, 1H, J₁₂ = 9.6 Hz, H-1'), 4.50 (d, 1H, H-4'), 4.36 (d, 1H, J₁₂ = 7.5 Hz, H-1'), 3.97-3.45 (m, 11 H, H-2-Fl-6, H-2', H-3', H-5', H-6'), 1.04 (S, 9H, t-BuSi), 1.03 (s, 9H, t-BuSi); ¹³C-NMR (CDCl₃) δ (ppm): 146.9 (C-para of SPhNO₂), 144.0 (C-ipso of SPhNO₂), 136.4-124.5 (28C, aromatic C), 103.7 (C-1'), 86.2 (C-1), 79.8, 76.6, 75.8, 74.4, 73.0, 72.0, 69.0 (C-6), 62.9 (C-6'), 27.4 (6C, 2tBu), 20.0 (Si-C≡), 19.7 (Si-C≡).

Para-Nitrophenyl O-(4,6-O-benzylidene-β-D-galactopyranosyl)-(1→4)-1-thio-β-D-glucopyranoside 117

179
Compound 106 (0.5 g 1.04 mmol) was suspended in 50 mL of dry acetonitrile and the reaction was heated to dissolve most of 106. \( \alpha,\alpha\)-Dimethoxyltoluene (0.5 mL) and a catalytic amount of \( p \)-toluenesulfonic acid were added at room temperature and the reaction mixture was then stirred for 15 min at 50°C. TLC (chloroform-methanol 3:1) showed complete conversion of the starting material. Triethylamine was added until the pH became lightly basic. The solution was concentrated under reduced pressure. The residue was purified by silica gel chromatography (6% methanol/dichloromethane) to afford 117 (0.55 g) in 93 % yield: m.p. 195-196 °C; [\( \alpha \)]\( _{D} \) -81.0° (c = 1.0, DMSO); IR (KBr, \( \nu_{\text{cm}^{-1}} \)): 3367 (br, OH), 1578, 1509, 1458, 1375, 1338, 1162, 1038, 855, 737; \( ^{1} \text{H}-\)NMR (DMSO-d6 with D\( _{2} \)O \( \delta \) (ppm): 8.18 (d, 1H, J\( _{\text{am}} \) = 9.1 Hz, H-meta), 7.63 (d, 1H, H-ortho), 7.50-7.39 (m, 7 H, aromatic H), 5.59 (s, CH(O\( \text{Me} \))\(_{2} \), 5.04 (d, 1H, J\( _{12} \) = 9.9 Hz, H-1), 4.44 (d, 1H, J\( _{1',2'} = 7.6 \) Hz, H-1'), 4.45-3.29 (m, 12 H, H-2 - H-6, H-2' - H-6'); \( ^{13} \text{C}-\)NMR (DMSO-d6) \( \delta \) (ppm): 146.7 (C-para of SPhNO\(_{2} \)), 146.4 (C-ipso of SPhNO\(_{2} \)), 129.5 (C-meta of SPhNO\(_{2} \)), 124.5 (ortho of SPhNO\(_{2} \)), 110.1 (O-C-O), 104.3 (C-1'), 86.2 (C-1), 81.8, 80.6, 80.6, 80.0, 75.0, 74.5, 74.1, 74.0, 62.3 (C-6'), 62.2 (C-6), 63.8 (C-6), 28.4, 26.5 (2xCH\(_{3} \)); \( ^{13} \text{C}-\)NMR (CDCl\(_{3} \) \( \delta \) (ppm): 146.3-123.9 (12C, aromatic C), 102.9 (O-C-O), 99.9 (C-1'), 84.587, 8.6, 78.3, 75.9, 75.5, 72.0, 71.5, 69.9, 68.4, 66.3, 59.9.

Para-Nitrophenyl O-(4,6-O-benzylidene-\( \beta \)-D-galactopyranosyl)-(1→4)-6-O-tert-butyldimethylsilyl-1-thio-\( \beta \)-D-glucopyranoside 118

To a solution of compound 117 (139 mg, 0.203 mmol) in 10 mL of dry pyridine-methylene chloride (1:20) was added tert-butyldimethylsilyl chloride (165 mg, 2.10 mmol) at 0 °C. The reaction mixture was then allowed to reach room temperature and stirring was continued for 12 hours. TLC (8:1 methanol-chloroform) showed that the starting material 117 (Rf = 0.15) was converted to product 118 (Rf = 0.46). Work up was done as standard procedure and the product was purified by silica gel column chromatography (2:1 ethyl acetate-hexane). Compound 118 (114.8 mg) in 83 % yield: m.p. 103-105 °C; [\( \alpha \)]\( _{D} \) -62.0°
(c = 1.0, CHCl₃); IR (KBr, \(\nu_{\text{cm}^{-1}}\)): 3385, 2909, 1595, 1514, 1457, 1374, 1340, 1253, 1163, 1060, 902, 838, 777, 741; FAB-MS (glycerol) gave m/z (ion, relative intensity): 682.2 ([M+1]^+, 7.3%), 781.3 ([M+1-HSPhNO₂]^+, 11.3%); \(^1\)H-NMR (CDCl₃) \(\delta\) (ppm): 8.10 (d, 1H, J₀,m = 9.0, H-meta), 7.61 (d, 1H, H-ortho), 7.48-7.35 (m, 7H, aromatic H), 5.52 (s, CH(OMe)₂), 4.72 (d, 1H, J₁₂ = 9.8 Hz, H-1'), 4.40 (d, 1H, J₁₂ = 7.7 Hz, H-1'), 4.27 (dd, 1H, J₅₆ = 1.2, J₆₆,₆₆ = 12.7 Hz, H-6a), 4.19 (dd, 1H, J₃₄ = 2.7 Hz, H-4'). 4.07 (dd, 1H, J₅₆ = 1.7 Hz, H-6b), 3.96-3.44 (m, 12H, H-2', H-4', H-5', H-6'), H-2 - H-5); \(^13\)C-NMR (CDCl₃) \(\delta\) (ppm): 146.5 (C-para of SPhNO₂), 143.1 (C-ipso of SPhNO₂), 137.2 - 123.8 (10C, aromatic), 103.3 (O-C-O), 101.3 (C-1'), 85.8 (C-1), 79.4, 79.1, 76.2, 75.0, 72.6, 72.0, 71.1, 68.9 (C-6'), 66.9, 62.1 (C-6), 25.8 (3C, Si⁻Bu), 18.3 (SiC=-), -5.2, -5.3 (SiCH₃).

Para-Nitrophenyl O-(β-D-galactopyranosyl)-(1→4)-2-acetamido-2-deoxy-1-thio-β-D-glucopyranoside

To a methanolic solution (10 mL) containing peracetylated N-acetyllactosamine 10 (860 mg, 1.12 mmol) was added a solution of NaOMe until the pH of the reaction mixture became ca. 9. The de-O-acetylation was completed within 30 min. The solution was neutralized by adding H⁺ resin (IR 120) and filtered. The filtrate was concentrated under reduced pressure to a yellowish solid which was pure enough for the next step as indicated by \(^1\)H-NMR. An analytical sample could be recrystallised from ethanol giving fine needles. The Zemplén deacetylation reaction was quantitative: m.p. 211.2-214.3 °C; \([\alpha]_D\) -1.73° (c = 1.0, DMSO); FAB-MS (glycerol) gave m/z (ion, relative intensity): 521.2 ([M+1]^+, 6.4%), 366.15 ([M+1-HSPhNO₂]^+, 3.4%), \(^1\)H-NMR (D₂O) \(\delta\) (ppm): 8.21 (d, 2H, J₀,m = 9.1 Hz, H-meta), 7.62 (d, 2H, H-ortho), 5.18 (d, 1H, J₁₂ = 10.0 Hz, H-1'), 4.51 (d, 1H, J₁₂ = 7.2 Hz, H-1'), 4.08-3.52 (m, 12 H, H2-H6, H2'-H6'); \(^13\)C-NMR (D₂O) \(\delta\) (ppm): 175.2 (C=O, NHAc), 146.7 (C-para of SPhNO₂), 144.3 (C-ipso of SPhNO₂), 181
129.5 (C-meta of SPNO₂), 124.9 (C-ortho of SPhNO₂), 103.7 (C-1'), 85.4 (C-1), 79.8 (C-5), 78.8 (C-3), 76.2 (C-4), 74.4 (C-3'), 73.3 (C-5'), 71.8 (C-2'), 69.4 (C-4'), 61.9 (C-6), 61.0 (C-6'), 54.6 (C-2).

Para-Nitrophenyl O-(6-O-t-butyldiphenylsilyl-β-D-galactopyranosyl)-(1→4)-2-actamido-6-O-t-butyldiphenylsilyl-2-deoxy-1-thio-β-D-glucopyranoside 119

Dry pyridine (2x5 mL) was evaporated from 115 (340 mg, 0.66 mmol) and the residue was dissolved in 5 mL of dry pyridine again. The solution was cooled to 0°C. Tert butyldiphenylsilyl chloride (269.6 mg, 0.91 mmol, 1.5 eq per OH) was added. The reaction mixture was warmed to room temperature and stirred for 8 hours. The reaction mixture was concentrated under reduced pressure. Column chromatography using 4% methanol-dichloromethane as eluent gave the titled compound 119 (586 mg) in 89% yield: m.p. 119-120 °C; [α]D -53.2° (c = 1.0, CHCl₃); FAB-MS (glycerol) gave m/z (ion, relative intensity): 1995.28 ([2M+1]⁺, 1.3%), 997.38 ([M+1]⁺, 7.5%), 842.38 ([M+1-HSPhNO₂]⁺, 17.0%); ¹H-NMR (500 MHz, CDCl₃) δ (ppm): 7.93 (d, 2H, J₉₋₁₀ = 8.7 Hz, H-ortho), 7.44 (d, 2H, H-meta), 7.70-7.25 (m, 20H, 4xPh), 5.01 (d, 1H, J₁₋₂ = 10.0 Hz, H-1'), 4.43 (d, 1H, J₁₋₂' = 7.7 Hz, H-1'), 4.00-3.40 (m, 12 H, H₂-H₆, H₂'-H₆'), 1.92 (s, 3H, NHAc), 1.01 (s, 9H, Si(CH₃)₃), 0.99 (s, 9H, Si(CH₃)₃); ¹³C-NMR (125.7 MHz, CDCl₃) δ (ppm): 171.2 (C=O, NHAc), 146.0 (C-para of SPhNO₂), 144.5 (C-ipso of SPhNO₂), 135.7 - 123.8 (m, 28C, Aromatic), 103.2 (C-1'), 84.5 (C-1), 79.2 (C-4), 78.8 (C-5), 75.2 (C-5'), 73.7 (C-3'), 73.1 (C-3), 71.4 (C-2'), 68.3 (C-4'), 62.6 (C-6), 62.2 (C-6'), 55.3 (C-2).

Para-Nitrophenyl O-(4,6-O-benzylidene-β-D-galactopyranosyl)-(1→4)-2-actamido-2-deoxy-1-thio-β-D-glucopyranoside 120

To a suspension of lactosamine derivative 115 (260 mg, 0.5 mmol) in acetonitrile (3 mL) was added benzaldehyde dimethylacetal (225 μL, 1.5 mmol), and p-toluenesulfonic acid monohydrate (catalytic amount). The mixture was stirred for 25 min at room temperature. Triethylamine (150 μL) was added, and the reaction mixture was
concentrated under reduced pressure. The residue was then purified by column chromatography on silica gel (5% ethanol in dichloromethane) to give 120 (270 mg) in 89% yield: m.p. 196-197 °C; [α]D -14.3° (c = 1.0, DMSO); FAB-MS (glycerol) gave m/z (ion, relative intensity): 1217.91 ([2M+1]+, 1.3%), 609.50 ([M+1]+, 22.8%), 454.2([M+1-HPhNO2]+, 8.9%); 1H-NMR (500 MHz, DMSO-d6) δ (ppm): 8.12 (d, 2H, J_{o,m} = 9.0 Hz, H-ortho of SPhNO2), 7.96 (d, 1H, J_{m,p} = 9.2 Hz, H-para of Ph), 7.59 (d, 2H, H-meta of SPhNO2), 7.45-7.43 (m, 2H, H-meta of Ph), 7.36-7.34 (m, 2H, H-ortho of SPh), 5.56 (s, 1H, O-PhCHO), 5.05(d, 1H, J_{1,2} = 10.4 Hz, H-1), 4.43 (d, 1H, J_{1',2'} = 7.7 Hz, H-1'), 4.09 (dd, 1H, J_{1',4'} = 3.4, J_{4',5'} < 1.0 Hz, H-4'), 4.08 (dd, 1H, J_{5',6a'} < 1.0, H_{6a'}, H_{6b} = 11.4 Hz, H-6a'), 4.03 (dd, 1H, J_{5',6a'} < 1.0 Hz, H-6a'), 3.82-3.31 (m, 9H, H-2', H-3', H-5'), 1.81 (s, 3H, NHAc); 13C-NMR (125.7 MHz, DMSO-d6) δ (ppm): 169.4 (C=O, NHAc), 145.8 (C-para of SPhNO2), 145.0 (C-ipso of SPhNO2), 138.5 (C-ipso of SPh), 128.7 (C-para of SPh), 128.0 (C-ortho of SPh), 127.6 (C-meta of SPhNO2), 126.2 (C-meta of SPh), 123.8 (C-ortho of SPhNO2), 103.1 (C-1'), 99.8 (O-C-O), 83.9 (C-1), 79.1 (2C, C-5, C-3), 75.7 (C-4), 73.2 (C-3'), 71.7 (C-5'), 70.0 (C-2'), 68.4 (C-6), 66.4 (C-4'), 60.0 (C-6'), 53.6 (C-2).

Para-Nitrophenyl O-(4,6-O-benzylidene-β-D-galactopyranosyl)-(1→4)-2-acetamido-6-O-t-butyldiphenylsilyl-2-deoxy-1-thio-β-D-glucopyranoside 121

Lactosamine derivative 120 (200 mg, 0.32 mmol) was dissolved in dry pyridine (2 mL). The solution was cooled to 0°C. Tert-butyldiphenylsilyl chloride (78.5 μL, 0.30 mmol, 1.8 eq per OH ) was added. The reaction mixture was stirred at room temperature for 12 hours. The reaction mixture was concentrated under reduced pressure. Column chromatography using 4% methanol-methylene chloride as eluent gave the titled compound (252 mg) in 90% yield: m.p. 149-151 °C; [α]D -57.0° (c = 1.2, CHCl3); FAB-MS (glycerol) gave m/z (ion, relative intensity): 1694.5 ([2M+1]+, 0.7%), 847.3 ([M+1]+, 9.0%), 692.3 ([M+1-HPhNO2]+, 18.4%); 1H-NMR (500 MHz, CDCl3) δ (ppm): 7.94 (d,
Para-Nitrophenyl O-(methyl 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-D-
glycero-α-D-galacto-2-nonulopyranosylonate)-(2→3)-O-(6-O-benzoyl-β-D-
galactopyranosyl)-(1→4)-2,6-di-O-benzoyl-1-thio-β-D-glucopyranoside 122

To a solution of lactosyl acceptor 113 (100 mg, 0.126 mmol) and methyl (phenyl
5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-2-thio-D-glycero-α-D-galacto-
nonulopyranosid) onate 12 (110 mg, 0.189 mmol) in dry propionitrile (5 mL) was added
molecular sieves-4Å (200 mg) and the mixture was stirred for 4 hours at room
temperature. The mixture was then cooled to -60°C and N-iodosuccinimide (56 mg, 0.252
mmol) and trifluoromethanesulfonic acid (10.4 µL, 0.126 mmol) were added. The reaction
mixture stirred at -60°C under nitrogen atmosphere. The progress of the reaction was
closely monitored by TLC at 5 min a interval. The reaction was essentially finished within
50 min with less than 10% of the acceptor unreacted as judged from the TLC. The
reaction mixture was diluted with CH₂Cl₂ (15 mL) and filtered through a layer of celite.
The filtrate was washed with 10% Na₂S₂O₃ (15 mL), saturated NaHCO₃ (2x15 mL) and
brine (2x15 mL). The organic phase was dried over Na₂SO₄ and concentrated under
reduced pressure. The crude residue was purified by silica gel chromatography using ethyl
erther/ethanol (1:1) as eluent to afford trisaccharide 122 (75.2 mg) in 47%: m.p.

(+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 1265 ([M]+, 2.7%), 1205.3 ([M-
AcOH]+, 4.4%), 1111.3 ([M-HSPhNO₂]⁺, 10.6 %), 740.3 ([M-525.1]⁺, 16.2%); ¹H-NMR
(500 MHz, CDCl3) δ (ppm): 8.06-7.28 (m, 19H, aromatic). 5.37 (dd, 1H, J8-9α = 2.6, J8-9β = 6.7 Hz, H-8”), 5.29 (dd, 1H, J2,3 = 9.0 Hz, H-2), 5.27 (dd, 1H, J7-8α = 8.2 Hz, H-7”), 5.10 (dd, 1H, J5,6α = 1.9, J6a,6b = 12.1 Hz, H-6α), 5.24 (d, 1H, J = 9.8 Hz, NH), 5.00 (d, 1H, J1,2 = 10.1 Hz, H-1), 4.96 (dd, 1H, J3e-4α = 11.9, J3c-4α = 4.6, J4α-5α = 10.4 Hz, H-4”), 4.74 (dd, 1H, J6b,6c = 12.1 Hz, H-6a”), 4.59 (d, 1H, J1′,2′ = 7.9 Hz, H-1′), 4.49 (dd, 1H, J5,6b = 6.9 Hz, H-6b), 4.35 (dd, 1H, J1′,6b = 8.9 Hz, H-6b”), 4.30 (dd, 1H, J9α,9β = 12.5 Hz, H-9a”), 4.16 (dd, J2′,3′ = 3.2 Hz, H-3′), 4.12 (dd, 1H, J6′,7′ = 1.7 Hz, H-6′), 4.02 (dd, 1H, J3,4 = 8.7 Hz, H-3), 4.00-3.95 (m, 4H, H-5, H-3′, H-5′, H-9b”), 3.90 (dd, 1H, J5,6α = 3.3 Hz, H-5′), 3.80 (d, 1H, J2,3′ = 9.7 Hz, H-2′), 3.74 (dd, 1H, J4,5 = 9.7 Hz, H-4), 3.70 (d, 1H, H-4′), 2.69 (dd, 1H, J3e-4α = 4.6, J3e-3α = 12.9 Hz, H-3e), 2.13, 2.06, 2.02, 1.95, 1.88 (5s, 5x Ac); 13C-NMR (125.8 MHz, CDCl3) δ (ppm): 170.8, 170.5, 170.3, 170.2, 170.1 (OCOCH3, NCOCH3) 168.07 (C-1”, JC₁₇”-H-1” = 4.2 Hz), 166.6, 165.9, 165.3 (PhCO), 146.5 (C-para), 142.7 (C-ipso), 133.5-123.6 (Aromatic C), 104.4 (C-1”), 97.5 (C-2”), 84.1 (C-1), 82.0 (C-4), 76.9 (C-5), 76.5 (C-3”), 74.8 (C-3), 73.1, 73.0 (C-5”, C-6”), 71.4 (C-2), 68.8 (C-8”), 68.7 (C-2”), 68.1, 68.1 (C-4′, C-4”), 67.0 (C-7”), 63.6, 63.5 (C-6, C-6”), 62.4 (C-9”), 53.3 (OCH3), 49.7 (C-5”), 37.8 (C-3”), 23.1 (NCOCH3), 21.1, 20.8, 20.7, 20.6 (OCOCH3).

Ethyl 2,3,4-tri-O-benzyl-L-thio-β-L-fucopyranoside 93

The synthesis of 93 was performed following a slight modification of previously described one pot two-step procedure. L-fucopyranose (1.0 g, 61 mmol) was treated with acetic anhydride-pyridine (30 mL, 2:1) at 100°C for 1 hour. The solution was concentrated and coevaporated with toluene (2×10 mL). The product was dissolved in dichloromethane (25 mL), ground molecular sieves (2.5 g, 4 Å), ethanethiol (1 mL), and stannium (IV) chloride (0.9 mL) were added at room temperature. The mixture was stirred for 1 hour, filtered through a layer of Celite, washed with ice-cold 1 M sulfuric acid, aqueous sodium bicarbonate, and water. The organic phase was dried (Na₂SO₄) and
concentrated. The residue was dissolved in methanol (25 mL) containing catalytic amount of sodium methoxide and was stirred until TLC revealed one major compound having Rf 0.14 (chloroform-acetone, 2:1). The solution was added diluted acetic acid in methanol until pH = 7. The solution was then concentrated under reduced pressure and the residue was dissolved in N,N-dimethylformamide (15 mL) containing benzyl bromide (3.2 mL). Sodium hydride as an oil suspension (50 %) (880 mg) was added at 0°C under nitrogen. After 1 hour, methanol (2 mL) was added, and the mixture was partitioned between toluene and water. The organic layer was washed with 5% HCl, water and concentrated. The residue was purified by column chromatography (ethyle acetate-hexane, 6:1) to afford 93 (1.79 g) in 61 % yield: m.p. 53.2-54.8 °C; [α]_D° +13.5° (c = 1.0, CHCl_3); ¹H-NMR (500 MHz, CDCl_3) δ (ppm): 7.40-7.23 (m, 15H, 3xBn), 4.38 (d, 1H, J₁,₂ = 9.6 Hz, H-1), 3.82 (dd, 1H, J₂,₃ = 9.4 Hz, H-2), 3.61 (dd, 1H, J₄,₅ < 1.0 Hz, H-4), 3.56 (dd, 1H, J₃,₄ = 3.4 Hz, H-3), 3.47 (dq, 1H, J₅,₆ = 6.4 Hz, H-5), 2.73 (m, SCH₂), 1.29 (t, J = 10.3 Hz, SCH₂CH₃), 1.20 (d, H-6); ¹³C-NMR (125.8 MHz, CDCl_3) δ (ppm): 138.7-127.5 (18C, 3xBn), 85.0 (C-1), 84.5 (C-3), 78.4 (C-2), 76.6 (C-4), 75.7 (CH₂), 74.6 (2C, CH₂, C-5), 72.9 (CH₂), 24.6 (SCH₂), 17.2 (C-6), 15.0 (SCH₂CH₃).

Para-Nitrophenyl O-(methyl 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosylate)-(2→3)-O-6-O-benzoyl-β-D-galactopyranosyl-(1→4)-[(2,3,4-tri-O-benzyl-α-L-fucopyranosyl)-(1→3)] -2,6-di-O-benzoyl-1-thio-β-D-glucopyranoside 123

To a solution of GM₃ trisaccharide 122 (30 mg, 22.7 μmol) and ethyl 2,3,4-tri-O-benzyl-1-thio-β-L-fucopyranoside 93 (13.5 mg, 28.5 μmol) in dry dichloromethane (1.5 mL) was added 4 Å molecular sieves (40 mg). The mixture was stirred under nitrogen atmosphere for 2 hours at room temperature and then cooled to -70°C. To the cooled mixture was added N-iodosuccinimide (9.6 mg, 42.6 μmol) and triflic acid (0.42 μL, 4.5 μmol) and the solution was stirred for 30 min at -70 °C. The reaction mixture was filtered through a Celite pad. The filtrate was diluted with dichloromethane (5 mL) and washed with water (5 mL), 10 % Na₂S₂O₃ (6 mL), saturated NaHCO₃ (8 mL) and water (5 mL).
The organic phase was dried (Na₂SO₄), filtered and evaporated to a syrup that was chromatographed on silica gel using 1:6 acetone-dichloromethane as eluent to afford 93 (24 mg) in 63% yield: Rf = 0.4 (1:3 acetone-dichloromethane); [α]D 12.2° (c = 0.58, CHCl₃); (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 1681 ([M]+, 0.3%), 1425 ([M-HSPHNO₂]+, 4.3%). ¹H-NMR (500 MHz, CDCl₃) δ (ppm): 8.07-7.26 (m, 34H, aromatic), 5.58 (d, 1H, J₁₂ = 4.1 Hz, H-1, Fuc), 5.46 (ddd, 1H, J₈,₉₈ = 2.6, J₈,₉₉ = 6.9 Hz, H-8, NeuAc), 5.32 (dd, 1H, J₂,₃ = 9.1 Hz, H-2, Glu), 5.27 (dd, 1H, J₇,₈ = 8.9 Hz, H-7, NeuAc), 5.18 (d, 1H, J = 9.9 Hz, NH), 5.16 (dd, 1H, J₅,₆₄ = 1.9, J₆₄,₆₅ = 12.1 Hz, H-6a, Glu), 5.02 (d, 1H, J₁₂ = 10.1 Hz, H-1, Glu), 4.91 d, 1H, J = 11.6 Hz, CH₂), 4.87 (ddd, 1H, J₄,₅ = 9.8 Hz, H-4, NeuAc), 4.84-4.68 (m, 4H, CH₂), 4.67 (d, 1H, J₁₂ = 8.0 Hz, H-1, Gal), 4.59 (d, 1H, J = 11.6 Hz, CH₂), 4.51 (dd, 1H, J₅,₆₅ = 4.2 Hz, H-6b, Gal), 4.48 (dd, 1H, J₁,₆₆ = 7.0 Hz, H-6b, Glu), 4.28-4.25 (m, 2H, H-6a of Gal, H-9b of NeuAc), 4.23 (dd, 1H, J₃,₄ = 2.4 Hz, H-3, Gal), 4.17 (dd, 1H, J₆,₇ = 2.6 Hz, H-6, NeuAc), 4.12-4.01 (m, 5H, H-2 of Gal, H-3 of Glu, H-2 of Fuc, H-9 of NeuAc), 3.95 (m, 1H, H-5, Gal), 3.93 (dd, 1H, J₅,₆ = 10.2 Hz, H-5), 3.87 (dd, 1H, J₂,₃ = 10.4, J₁,₄ = 2.8 Hz, H-3, Fuc), 3.84 (d, 1H, J₃,₄ = 2.0 Hz, H-4, Gal), 3.80 (s, 3H, OCH₃), 3.79 (dq, 1H, H-5, Fuc), 3.76 (dd, 1H, J₄,₅ = 9.0 Hz, H-4, Glu), 3.65 (d, 1H, H-4, Fuc), 2.54 (dd, 1H, J₃,₄ = 4.4, J₃,₃₄ = 12.7 Hz, H-3e, NeuAc), 2.17, 2.08, 2.01, 1.98, 1.88 (5s, 15H, OAc, NHAc), 1.03 (d, 1H, J₅,₆ = 6.5 Hz, H-6, Fuc); ¹³C-NMR (125.7 MHz, CDCl₃) δ (ppm): 170.4, 170.1, 169.8 (2C), 169.8 (2C), 167.5, 165.4, 164.9 (9xC=O), 151.9-123.3 (42C, Aromatic), 104.7 (C-1, Gal), 96.9 (C-2 of NeuAc, C-1 of Fuc), 83.7 (C-1, Glu), 81.8 (C-4, Glu), 78.4 (C-3, Fuc), 77.6 (C-3, Gal), 77.5 (C-3, Glu), 76.0 (C-4, Fuc), 75.4 (C-5, Glu), 74.4 (CH₂), 74.3 (C-2, Gal), 72.9 (C-6 of NeuAc, C-5 of Gal), 72.5, (CH₂), 72.4 (CH₂), 71.2(C-2, Glu), 70.0 (C-4, Gal), 68.1 (C-2, Fuc), 67.7 (C-8, NeuAc), 67.6 (C-4, NeuAc), 66.8 (C-5, Fuc), 66.4 (C-7, NeuAc), 53.6 (C-6, Glu), 53.3 (C-6, Gal), 62.1 (C-9, NeuAc), 53.0 (OCH₃), 49.1 (C-5, NeuAc), 37.5 (C-3, NeuAc), 22.8, 20.9, 20.4 (2C), 20.3 (5xCH₃, NHAc, OAc), 16.4 (C-6, Fuc).

* Assignment may be interchangeable.
Para-Nitrophosphale O-(methyl 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dioxy-D-glycero-α-D-galacto-2-nonulopyranosyl)one-(2→3)-O-(6-O-tert-butyldiphenylsilyl-β-D-galactopyranosyl)-(1→4)-6-O-tert-butyldiphenylsilyl-2-acetamido-2-deoxyl-1-thio-β-D-glucopyranoside 124

To a solution of 93 (60 mg, 0.06 mmol) and methyl (phenyl 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dioxy-2-thio-D-glycero-α-D-galactononulopyranosid) onate 12 (60 mg, 0.103 mmol) in dry propionitrile (2 mL) was added 4 Å molecular sieves (120 mg). The mixture was stirred for 4 hours under nitrogen. The mixture was then cooled to -60 °C and N-iodosuccinimide (45 mg, 0.12 mmol) and trifluoromethanesulfonic acid (15.6 μL, 0.06 mmol) were added. The reaction mixture stirring at -60 °C under nitrogen. The progress of the reaction was closely monitored by TLC at 5 min intervals. The reaction was essentially finished within 50 min with less than 15% of the acceptor unreacted as judged from the TLC. The reaction mixture was then diluted with CH2Cl2 (10 mL) and filtered through a layer of celite. The filtrate was washed with 10% Na2S2O3 (10 mL), saturated NaHCO3 (2x10 mL), and brine (2x10 mL). The organic phase was dried over Na2SO4 and concentrated under reduced pressure. The foamy residue was purified by silica gel chromatography using 8% t-butanol in dichloromethane as eluent to afford trisaccharide 125 (43 mg) in 46% yield: [α]D<sub>20</sub> 20.7° (c = 0.70, CHCl3); (+)-FAB-MS (glycerol) gave m/z (ion, relative intensity): 1315.5 ([M+1-HSPHNO3]+, 1.6%); 1H-NMR (500 MHz, CDCl3) δ (ppm): 7.84 (d, 2H, J<sub>8,9a</sub> = 9.0 Hz, H-ortho), 7.61 (d, 2H, H-meta), 7.67-7.19 (m, 20H, aromatic), 5.57 (d, 1H, J<sub>8,9b</sub> = 6.0 Hz, H-8”), 5.27 (dd, 1H, J<sub>7</sub>""\textsuperscript{7} = 8.7 Hz, H-7”), 5.20 (d, 1H, J<sub>5</sub>""\textsuperscript{5} = 9.8 Hz, NH), 5.02 (d, 1H, J<sub>1,2</sub> = 9.8 Hz, H-1), 4.92 (ddd, 1H, J<sub>3a</sub>""\textsuperscript{3a} = 11.9, J<sub>2e</sub>""\textsuperscript{2e} = 4.6, J<sub>4</sub>""\textsuperscript{4} = 10.1 Hz, H-9a""), 4.51 (d, 1H, J<sub>1</sub>""\textsuperscript{1} = 7.7 Hz, H-1'), 4.22 (dd, 1H, J<sub>6</sub>""\textsuperscript{6} = 12.4 Hz, H-9a""), 4.16 (dd, 1H, J<sub>5,6a</sub> = 1.0, J<sub>6a,5b</sub> = 10.4 Hz, H-6a), 4.09 (dd, J<sub>3c</sub>""\textsuperscript{3c} = 3.6 Hz, H-3'), 4.07 (dd, 1H, J<sub>6c</sub>""\textsuperscript{6c} = 1.8 Hz, H-6c'), 3.96 (dd, J<sub>5c</sub>""\textsuperscript{5c} = 10.1 Hz, H-5c""), 3.94 (d, 1H, J<sub>5c</sub>""\textsuperscript{5c} = 6.0 Hz, H-6b), 3.92 (d, 1H, J<sub>5c</sub>""\textsuperscript{5c} = 6.0 Hz, H-9b""), 3.89 - 3.78 (m, 4H, H-2, H-5, H-6a, H-6b""), 3.75 (d, 1H, J<sub>4</sub>""\textsuperscript{4} = 1.0 Hz, H-4""), 3.74 (s, 3H, OMe), 2.72-3.58 (m, 4H, H-3, H-4, H-2', H-5""), 2.69 (dd, 1H, J<sub>3c</sub>""\textsuperscript{3c} = 4.5, J<sub>3c</sub>""\textsuperscript{3c} = 12.0 Hz, H-3e), 2.08, 2.02, 2.01, 1.94,

Chapter 5  Glycopolymers

5.1 Introduction

Synthetic glycoconjugates are a family of carbohydrate derivatives which include glycoproteins, glycolipids, and glycopolymers.218 Glycopolymers are gaining increasing interest owing to the many advantageous physical and immunochemical properties with which they can be designed.64,219,220 Glycopolymers can possess uniform and stable structures having a wide range of molecular weights, carbohydrate densities and functionalities. Their purification and characterizations are easier. They can be produced inexpensively and in large scale. They can also be used advantageously as multivalent inhibitors or for cell targeting since they are non or poorly immunogenic.64 In addition, they can be used directly in quantitative immunoprecipitation and in enzyme-linked immunosorbent assays (ELISA).221,222 Moreover the well-recognized “cluster effect” of carbohydrate ligands for their specific receptors can be fully appreciated by virtue of the intrinsic multivalent structures of the polymers.223,224

Two decades have past since Horejsi and Kocourek225 first described an entirely new approach to make useful artificial carbohydrate antigens. In this method, simple allyl glycosides were copolymerized with acrylamides with a radical initiator in an aqueous environment to yield multivalent antigenic polymers bearing pendant carbohydrate

residues. Allyl glycosides have also been used in co-polymerizations with acrylamide. The reactivity of alkenyl glycoside monomers in radical copolymerizations is lower than that of acrylamide. Therefore, excess of carbohydrate monomer is needed if a high density of saccharide is desired in the final glycopolymers. In contrast, glycosides bearing acryloyl residues have reactivities similar to that of acrylamide, thereby making it possible to control saccharide density in the co-polymer by controlling the monomer ratios in the polymerization mixture. Furthermore, the incorporation of acrylamidoalkyl glycosides into glycopolymers is practically quantitative.

Scheme 5.1 Common Strategy for the Synthesis of Polyacrylamide Based Glycopolymers

---

Glycosides having acrylamide groups in the aglycon are accessible via acryloylations of glycosides bearing amine groups in the aglycon. Copolymerization of acrylamido containing glycosides with acrylamide can proceed in the presence of ammonium persulfate. A general synthetic strategy for the preparation of polyacrylamide-based conjugates is illustrated in Scheme 5.1.

In the following section, lactose- and GM$_3$-containing glycopolymer syntheses using pre-formed N-acryloylated carbohydrates as monomer precursors are described. The carbohydrate monomer and co-monomer (acrylamide) contain common terminal functionality in order to maximize the homogeneous polymerization environment between the monomers and thus minimize discrete block polymer formation.

### 5.2 Para-Nitrophenyl Thiolactoside as Precursors to Glycoconjugates

Lactose was chosen as a good ligand model because it is an important hepatocyte receptor, and because suitably protected lactosyl copolymer precursor could be readily available in large scale. Peracetylated para-nitrophenyl thiolactoside 11 was prepared as described in the Section 2.1 under phase transfer catalyzed (PTC) conditions. Zemplén de-O-acetylation of peracetylated lactoside 11 afforded 106 quantitatively. The aromatic nitro group of 106 can be reduced using tin (II) chloride as discussed previously in Section 3.3. In a more efficient way, we found later that the nitro group could be also reduced into amine under even milder conditions. As model compound, 106 was dissolved in a mixture solvent of acetic acid and methanol (1:5) at room temperature and the resulting solution was added a large excess of Zinc dust (10 equiv.). The reduction was finished within 30 min. Once complete, filtration and evaporation of the solution under reduced pressure provided p-aminophenyl thioglycoside 125a. Amine 125a was directly acryloylated without purification.

N-Acryloylation of 125a was performed in methanol solution with acryloyl chloride in the presence of triethylamine as base. The term-amine group was selectively

---

acylated by dropwise addition of a stock solution of acryloyl chloride in tetrahydrofuran to afford monomer precursor 125b in 91% yield for the two steps.

Scheme 5.2  Preparation of Para-N-Acrylamidophenyl 1-thio-β-D-Lactopyranoside 125b

With suitable glycosyl precursor 125b in hand, para-N-acrylamidophenyl 1-thio β-D-lactoside-co-acrylamide (Lactoside-S-Ω-CPA) 126a and 126b were prepared by copolymerization of 125b with acrylamide (1:10 and 1:20 molar ratios respectively) using ammonium persulfate [(NH₄)₂S₂O₈] as radical initiator with heat (90°C, 25 min.). The copolymerizations proceeded smoothly and gave 126a and 126b in 57% and 59% yields respectively. The glycopolymers produced were purified and easily isolated by dialysis and freeze drying to give white, spongy solids containing typically between 9 and 15% of retained water. The monomer ratios incorporated within the glycopolymers were found to

---

be almost identical to the load ratios as judged by $^1$H-NMR spectra. In aryl glycoside glycopolymers, the aromatic proton resonance in the $^1$H-NMR spectra (D$_2$O) provided a good reporting group observed downfield (7.3-7.8 ppm, br) from the sugar resonances ($\delta$ 3.4-4.0 ppm, ring H) and the polymer backbone signal at $\delta$ 2.47-2.12 (br, methine) and at 1.97-1.32 (methylene). The N-Acetyl groups were found as relatively sharp singlets at 2.0 ppm, while much of the remaining $^1$H-NMR spectrum was composed of broadened signals.

It is worthy to mention that Lactoside-S-0-CPA 126 described here, differs from the Lactoside-O-0-CPA prepared in this group before.\textsuperscript{65b} The incorporation of an S-glycoside instead of O-glycoside should render the glycopolymer more stable toward the enzymatic hydrolysis by glucohydrolases.

Scheme 5.3 Synthesis of Lactosyl Glycopolymer
5.3 GM\textsubscript{3} as Precursor to Glycoconjugates

As shown in scheme 5.4, para-nitrophenyl thiotrisaccharide GM\textsubscript{3} 122 was efficiently reduced using zinc dust as catalyst in a mixture of acetic acid and dichloromethane (4:25) to give para-aminophenyl thiotrisaccharide 127. Reductions were usually finished within 30 min at room temperature and conversion was quantitative as judged by TLC. The amino derivative 127 was directly subjected to N-acryloylation without purification. N-Acryloylation of aminothiophenyl GM\textsubscript{3} 128 was performed with acryloyl chloride in dichloromethane using triethylamine as base at 0°C. The reaction was finished within 60 min and the key GM\textsubscript{3} monomer 128 was obtained in high yield (85\%). N-Acryloylated 128 had the same Rf value as the starting amino compound 127, but completion of the reaction could be monitored based on the color change of the spots on TLC. The structures of the GM\textsubscript{3} derivatives were confirmed by \textsuperscript{1}H-NMR and \textsuperscript{13}C-NMR spectra. Examples of \textsuperscript{1}H-NMR and \textsuperscript{1}H-\textsuperscript{1}H COSY, \textsuperscript{1}H-\textsuperscript{13}C HMQC NMR spectra of N-acryloylated GM\textsubscript{3} 128 are shown in figures 5.1-5.3.

The preparation of unprotected GM\textsubscript{3} monomer 131 by Zemplén de-O-acetylation (NaOMe, MeOH) and saponification (NaOH, H\textsubscript{2}O), was then needed. However, when 128 was first treated under Zemplén de-O-acetylation conditions, extensive addition of methoxyl anions to the N-acrylamido function (detected by \textsuperscript{1}H and \textsuperscript{13}C NMR analyses) resulted in 129. The molar ratio of the desired N-acryloylated GM\textsubscript{3} monomer 131 to conjugate addition product 129 was found to be 32:68 by analysis of the \textsuperscript{1}H-NMR signals. The acryloyl signals at δ 6.5-5.95 ppm were smaller than expected and a new triplet signal appearing at δ 2.78 ppm was reported and attributed to the NCH\textsubscript{2}CH\textsubscript{2}OMe group. A similar phenomena was previously observed during the course of preparation of sialic acid containing glycopolymer.\textsuperscript{65c} Selected \textsuperscript{13}C-NMR data for GM\textsubscript{3} derivatives 122, 127, 128, 131 are given in table 5.1.

Chemical shifts $\delta$ are given in ppm relative to internal TMS and were recorded in 125.8 MHz for CDCl₃ solution (ref. 77.0 ppm). Assignment are based the $^{13}$C-NMR spectra of the precursors, adept and $^1$H-$^{13}$C HMQC experiments.
Scheme 5.4 Preparation of GM₃ Derivatives

However, addition of thioacetic acid to 128 was also desired. The addition product 133 is a valuable precursor for the preparation of dendritic GM₃.²³⁰,²³¹ Thioacetate derivative 133 was efficiently synthesized in 85% yield by adding thioacetic acid²³² to a solution of 128 in ethyl acetate in the presence of triethyl amine in 85% yield. Disappearance of signals attributed to the acryloyl group in the ¹H-NMR spectrum at δ

²³¹ Thioacetate derivative 133 could be de-S-acetylated with using hydrazinium acetate. The resulting thiol can react with various dendritic electrophiles to afford dendritic GM₃ compounds. The synthetic studies along this line are under current investigation in this laboratory.
6.40-5.75 ppm and appearance of new signals at δ 3.19 ppm (SCH₂), δ 2.64 ppm (CH₂CO), and at δ 2.33 ppm (s, SAc) clearly indicated the formation of derivative 133.

An alternative strategy was proposed as illustrated in Scheme 5.5. Zemplén de-O-acetylation (NaOMe, MeOH) and saponification (NaOH, H₂O) of 122 were executed before the reduction and N-acryloylation in order to eliminate the problem associated with the conjugate addition of methoxyl anions. In fact, this synthetic route was very efficient. Zemplén deacetylation and saponification of 122 afforded deprotected GM₃ trisaccharide 130 in 95% yield. Subsequent reduction and N-acryloylation of 130 under conditions similar to the preparation of the lactose-containing monomer 125b, afforded desired GM₃ monomer 131b in 83% yield. It should be noted that the amine intermediate had the same Rf as that of the nitro compound 130 in several solvent systems. A large excess of Zinc dust and longer reaction time (60 min) were used to eliminate any possibility of under reduction.

Scheme 5.5 Synthesis of Unprotected GM₃ Monomer 131
The structure of deprotected GM₃ monomers 130 and 131 were fully characterized by ¹H and ¹³C NMR spectroscopy. The assignments were based on 2D NMR spectra (¹H-¹H COSY and ¹H-¹³C HMQC). Selected ¹³C-NMR data of 130 and 131 are given in table 5.3. As an example, the ¹H- and ¹³C-NMR spectra (D₂O) are depicted in Figures 5.4 and 5.5.

Figure 5.5  $^{13}$C-NMR and $^1$H-$^{13}$C-HMQC Spectra (125.7 MHz, D$_2$O) of GM$_3$ Trisaccharide 130
Similar to the preparation of lactosyl glycopolymer 126, the monomeric N-acrylamidophenyl thioglycoside 131b was copolymerized with acrylamide using ammonium persulfate as initiator in deoxygenated water (obtained by multiple cool-thaw cycles and bubbling nitrogen). The copolymerization generally proceeded at 90°C and finished within one hour. Good yields (50-70%) of GM3 copolymers with different GM3 monomer incorporation were obtained. As described earlier, the GM3 monomer ratios incorporated within the glycopolymers were found to be almost identical to the load ratio. This is especially true when lower amounts of acrylamide monomers were used (1/5, 1/10). The GM3 glycopolymers produced here were purified and easily isolated by dialysis and freeze drying to give white, spongy solids.

![Chemical structure of 131b and 132](image)

Scheme 5.6 Copolymerization of GM3 Monomer and Acrylamide
Alternatively, GM₃ glycopolymers could be prepared directly from the protected monomer 128 with acrylamide in deoxygenated DMF using AIBN as initiator. The obtained copolymer, after successive Zemplén de-O-acetylation (NaOMe, MeOH) and saponification (NaOH, H₂O) gave the same glycopolymers 332 as that prepared from the deprotected monomer 131 using ammonium persulfate as initiator.

The homogeneity of the glycopolymers structures was established by ¹³C-NMR spectroscopy. The spectrum of glycopolymers 132 showed a single set of relatively sharp resonances for the GM₃ residues. The aromatic ortho carbon as well as the anomic carbon attached to the phenyl ring were sharp but slightly broadened when compared to other carbohydrate resonances. The backbone methine and methylene resonances appeared in their usual position as broad peaks near 43 and 35 ppm, respectively. The ¹H- and ¹³C-NMR spectra of GM₃ polymer are given in Figure 5.6 and 5.7.

The most important feature of glycopolymers is probably the carbohydrate density. Mutivalency is an important factor in adhesion phenomena. Various methods have been utilized to quantitate the carbohydrate content of glycopolymers. Carbohydrate incorporation has been determined by colorimetric chemical assays by elemental analysis and from ¹H-NMR spectrum integrations.

¹H-NMR spectroscopy has proven to be a very simple, quick and effective tool for accurately determining the carbohydrate content in acrylate based glycopolymers. In the ¹H-NMR spectra of glycopolymers, resonances belonging to the sugar residue are found in the same chemical shift range as in the glycosides. Their position between 3.4 and 5 ppm are well removed from the residues arising from the polymer backbone found between 1 and 2.5 ppm. By comparing the relative integration ratios of these areas, an unambiguous value for the average carbohydrate density can be determined once the backbone resonance contribution from the glycoside comonomer has been taken into account. A typical ¹H-NMR spectra of a poly(acrylamide-co-GM₃) glycopolymers is shown in Figure 5.6. We found that one proton has an average integration value of ~1

---

Figure 5.6 $^1$H-NMR (500 MHz, D$_2$O) Spectrum of GM$_3$-S-Ø-CPA
unit. The total methylene and methine signals from all monomer units in the polymer backbone integrate for 37 units. The incorporation ratio of GM₃ in this copolymer is roughly 1:11, as deduced by subtracting the 4 proton contributions of the sialic acid moiety (NHAc and H-3a).

5.4 Evaluation of Antigenicity

Double radial diffusion assays through agarose gel were performed with plant lectins to test the antigenicity of GM₃-containing glycopolymers (GM₃-S-Ø-CPA) 132 and lactose-containing glycopolymers (Lactose-S-Ø-CPA) 126. In a first set of experiments, GM₃-S-Ø-CPA with sugar contents of 1:5.2, 1:11; 1:27, 1:48 and Lactose-S-Ø-CPA with sugar contents of 1:11, 1:21 were allowed to diffuse against wheat germ agglutinin (WGA). This carbohydrate-specific lectin²³⁵ is known to bind with Neu5Ac as well as GlcNAc. A photograph of the gel is given in Figure 5.8 and the results of double immunodiffusion of the polymers are reported in Table 5.3. As expected, all the GM₃-S-Ø-CPA 132, except the one with a very low sugar ratio (1:48), were proved to be antigenic towards WGA, while the Lactose-S-Ø-CPA 126 (wells 5 and 6) showed no antigenicity toward this plant lectin. It is not surprising that the glycopolymers with very low sugar contents showed no antigenicity considering the requirement of multivalent interaction for binding between antigens and lectins. In the second set of experiments, Peanut Lectin (Arachis Hypogea) was used against all the glycopolymers used in the first set of experiments. Opposite results were obtained, the lactose-S-Ø-CPA 126 showed precipitation bands and while GM₃-S-Ø-CPA 132 showed no bands.

Diffusion studies were also used to provide an indication of the relative molecular weight. Generally, the higher the molecular weight, the slower the diffusion rate in the gel.

It is apparent from figure 5.8 that the diffusion rates of all GM\(_3\) containing glycopolymers were much smaller than that of WGA lectin as precipitation bands are closer to the polymer wells that to the lectin well. It is known that WGA has a molecular weight of 43 kDa. According to the observed diffusion ratio, the estimated molecular weight of all the GM\(_3\) containing glycopolymers prepared here were larger than 50 kDa. It is known that molecular weights of glycopolymers increase as the concentration of the initiator decreases.\(^{236}\) In our copolymerization process, small amounts of ammonium persulfate were used, so it is not surprising that the glycopolymers obtained had relatively high molecular weights.

![Diagram showing agar gel diffusion assay](image)

**Figure 5.8** Agar gel diffusion assay of WGA (central well) against:

* Sugar contents in copolymers were determined by ¹H-NMR (500 Hz) spectroscopy

5.5 Conclusion

In summary, lactose and GM₃ containing glycopolymers with different sugar incorporations were successfully prepared. The glycopolymers prepared have approximate molecular weight ≥ 50 kDa and are water soluble. Preliminary double immunodiffusion experiments with the polymers revealed binding specificity between the sugar and plant lectins. Polymers with high sugar contents (1:5 and 1:11) showed good antigenicities, while glycopolymers with very low sugar contents (1:48) showed no detectable interaction between the glycopolymer and the lectins. Further quantitative evaluation of the antigenicities for these new glycopolymers and the influence of the sugar density on binding affinity will be pursued in due course.
5.6 Experimental Methods

Para-N-acrylamidophenyl O-(β-D-galactopyranosyl)-(1→4)-1-thio-β-D-glucopyranoside 125b

To a solution of para-nitrophenyl O-(β-D-galactopyranosyl)-(1→4)-1-thio-β-D-glucopyranoside 106 (500 mg, 1.04 mmol) in methanol and acetic acid (5 mL, 5:1 v/v) was added zinc dust (340 mg, 5.20 mmol) at 0 °C and the mixture was stirred at room temperature for 30 min. TLC (MeOH:CH₂Cl₂, 4:5, v/v) showed conversion of 106 (Rf = 0.53) to amine intermediate 125a (Rf = 0.37). The reaction was filtered through a layer of Celite with methanol used for rinsing. Evaporation of the solvent under reduced pressure gave a yellowish solid. The crude product was dried over KOH overnight to remove the trace of remaining acid. The residue was then dissolved in methanol (5 mL). The pH of the solution was adjusted to ca 8. To this cooled solution (ice bath) was added 350 μl of acryloyl chloride in 2 mL tetrahydrofuran. The reaction mixture was then stirred at room temperature for 2.5 hours. TLC (MeOH:CH₂Cl₂, 4:5, v/v) showed a clean and complete conversion of the amine (Rf = 0.37) to acrylamide 125 (Rf = 0.39). The reaction mixture was neutralized with H⁺ resin and concentrated under reduce pressure to drying mass. Purification by flash chromatography with a gradient of MeOH/CH₂Cl₂ (from 1:5 to 1:1 in v/v) gave 125 as yellowish solid (475 mg) in 91% yield: [α]D -34.8° (c = 1.3, H₂O); MS (FAB) gave m/e (ion, relative intensity): 504.2 ([M+H]+, 4.0 %); 1H-NMR (D₂O) δ (ppm): 7.63-7.51 (m, 4H, Ph ), 6.47 (dd, 1H, J₆⁻₇ = 1.1, J₇₋₈ = 17.0 Hz, =CH₂meta), 6.39 (dd, 1H, C(O)CH=), 5.93 (dd, 1H, J₆⁻₇ = 10.1 Hz, =CH₂ortho), 4.81 (d, 1H, J₆₋₇ = 10.1 Hz, H-1), 4.50 (d, 1H, J₁₋₂ = 7.8 Hz, H-1'), 4.03- 3.59 (m, 12 H, H-2-6, H-2'-6'); ¹³C-NMR (D₂O) δ (ppm): 166.3 (C=O), 136.5 (C-ipso), 132.5 (C-meta), 129.8 (CH=), 128.1 (CH₂=), 127.38 (C-para), 121.51 (C-ortho), 102.39 (C-1'), 86.17 (C-1), 78.23 (C-5'), 77.52 (C-5), 75.31 (C-3), 74.86 (C-3'), 72.05 (C-4), 70.92 (C-2), 70.46 (C-2'), 68.08 (C-4), 60.53 (C-6), 59.68 (C-6').

Anal. Calcd for C₂₃H₂₉O₁₁N₁S₁: 530.55: C, 47.54, H, 6.02, N, 2.64, Found: C, 47.39; H, 5.89; N, 2.55.
Poly (Para-N-acrylamidophenyl O-((β-D-galactopyranosyl)-(1→4)-1-thio-β-D-glucopyranoside-co-acrylamide) 126a and 126b

Compound 125 (10 mg, 19.8 μmol) and acrylamide (14 mg, 197.9 μmol) were dissolved in deoxygenated water (300 μL) obtained by multiple cool-thaw cycles and bubbling nitrogen. A small amount of (NH₄)₂S₂O₈ (0.18 mg, 0.792 μmol was added by injection of 36 μL of a stock solution, 5 mg/500 μL water). The reaction mixture was stirred at 90 °C for 15 min. TLC (MeOH/CH₂Cl₂, 1:1 in v/v) showed remaining monomers. Ammonium persulfate 36 μL of the stock solution was added again with stirring for an additional 12 min at 90°C. The reaction mixture was then diluted with water (1 mL) and dialyzed (2,000 MW cut off) exhaustively against multiple 1 L volumes of distilled water. Lyophilization gave 13.7 mg (57%) of Lactose-S-CPA 126a as a spongy white solid. The lactose/acrylamide ratio within the polymer was 1:11 as determined by ¹H NMR spectroscopy.

In a parallel manner Lactose-S-CPA 126b (lactose/acrylamide ratio within the polymer was 1:21) was prepared in 59 % yield: ¹H-NMR (500 MHz, D₂O) δ (ppm): 7.62-7.43 (br, 4H, Ph), 4.81 (1H, H-1), 4.51 (1H, H-1'), 4.03-3.41 (m, 12 H, H-2-6. H-2'-6'), 2.47-2.12 (br, methine of backbone), 1.97-1.32 (methylene of backbone); ¹³C-NMR (125.8 MHz, D₂O) δ (ppm): 179.1 (C=O, backbone), 174.5 (C=O), 136.2 (C-ipso), 132.4 (C-meta), 121.6 (br, C-para, C-ortho), 102.4 (C-1'), 86.9 (C-1), 78.2 (C-5'), 77.7 (C-5), 75.3 (C-3), 74.9 (C-3'),72.1 (C-4), 71.0 (C-2), 70.5 (C-2'), 68.1 (C-4), 60.6 (C-6), 59.7 (C-6'), 41.7-41.4 (br, methine of backbone), 38.3-33.6 (methylene of backbone).

Para-Aminophenyl O-(Methyl 5-acetamido-4,7,8,9-tera-O-acetyl-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosylate)-(2→3)-O-(6-O-benzoyl-β-D-galactopyranosyl)-(1→4)-O-2,6-di-O-benzoyl-1-thio-β-D-glucopyranoside 127

To a solution of para-nitrophenyl O-(methyl 5-acetamido-4,7,8,9-tera-O-acetyl-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosylate)-(2→3)-O-(6-O-benzoyl-β-
D-galactopyranosyl)-(1→4)-O-2,6-di-O-benzoyl-1-thio-β-D-glucopyranoside 122 (50 mg, 39.5 μmol) in dichloromethane (2.5 mL) was added acetic acid (400 μL) and zinc dust (30 mg). The mixture was stirred for 30 min at room temperature. TLC (3% methanol in dichloromethane) indicated the reaction to be finished (product Rf = 0.44 and ninhydrin positive). The excess zinc dust was filtered out and the reaction mixture was concentrated under reduced pressure. The crude product was purified by radial silica gel chromatography (Chromatotron 1 mm plat, 3% ethanol in dichloromethane) to afford 127 (45.4 mg) as amorphous solid in 97% yield: [α]D -7.9° (c = 0.70, CHCl3); IR: (Thin film, νcm): 3443 (br), 3068, 2947, 1731, 1601, 1585, 1535, 1451, 1370, 1255, 1119, 1070, 800, 714; 1H-NMR δ (CDCl3): 8.10 - 7.28 (m, 19H, Aromatic), 5.35 (ddd, 1H, J8.9a = 2.7, J8.9b = 6.8 Hz, H-8″), 5.32 (dd, 1H, J2.3 = 9.3 Hz, H-2), 5.29 (d, 1H, NH), 5.28 (dd, 1H, J7.8″ = 8.9 Hz, H-7″), 5.08 (dd, 1H, J5.6a ≤1.0, J6a6b = 11.8 Hz, H-6a), 4.97 (ddd, 1H, J4.5″ = 10.1 Hz, H-4″), 4.98 (d, 1H, J1.2 = 10.0 Hz, H-1″), 4.75 (ddd, 1H, J5.6a = 6.8 Hz, H-6a), 4.34 (dd, 1H, J5.6b = 8.9 Hz, H-6b″), 4.32 (dd, 1H, J9a.9b = 12.3 Hz, H-9a″), 4.15 (dd, J3.4″ = 2.6 Hz, H-3″), 4.12 (dd, 1H, J6.7″ ≤1.0 Hz, H-6″), 4.03 (dd, 1H, J3.4 = 9.0 Hz, H-3), 3.98-3.88 (m, 4H, H-4, H-5, H-5′, H-5″, H-5′″), 3.79 (d, 1H, J2.3 = 10.5 Hz, H-2′), 3.78 (s, 3H, OCH3), 3.75 (dd, 1H, J4.5 = 8.7 Hz, H-4), 3.68 (d, 1H, H-4″), 2.68 (dd, 1H, J3e-.4″ = 4.4, J3e-.3a = 12.9 Hz, H-3e), 2.14, 2.06, 2.02, 1.93, 1.88 (5s, 5x Ac); 13C-NMR (CDCl3, δ ppm): 170.8, 170.5, 170.3, 170.2 (OOCCH3, NCOCH3) 168.0 (C-1″), 166.6, 166.0, 165.3 (PhCO), 133.2-122.5 (24 C, aromatic C), 104.4 (C-1″), 97.5 (C-2″), 85.1 (C-1), 82.2 (C-4), 76.8 (C-5), 76.5 (C-3″), 75.0 (C-3), 73.1, (C-6″), 72.9 (C-5″), 71.7 (C-2), 68.9 (C-8″), 68.8 (C-2′), 68.2 (C-4″), 68.1 (C-4′), 67.0 (C-7″), 63.7 (C-6), 63.6 (C-6″), 62.5 (C-9″), 53.3 (OCH3), 49.8 (C-5″), 37.8 (C-3″), 23.2 (NCOCH3), 21.1, 20.8, 20.7, 20.61 (OOCCH3).
Para-N-Acrylamidophenyl O-(methyl 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-
dideoxy-D-glycero-α-D-galacto-2-nonulopyranosylonate)-(2→3)-O-(6-O-benzoyl-β-
D-galactopyranosyl)-(1→4)-O-2,6-di-O-benzoyl-1-thio-β-D-glucopyranoside 128

Compound 127 (49 mg, 0.0397 mmol) was dissolved in dichloromethane (3 mL). To this solution was added triethyl amine to adjust the pH ca. 8.0. The solution was then cooled to 0°C and acryloyl chloride (460 μL) in tetrahydrofuran (1% v/v) was added in a 15 min. period. The solution was then allowed to reach room temperature and stirring continued for an additional 2 hours. The solution was directly concentrated under vacuum to dryness. The residue was purified by silica gel chromatography using 2% ethanol in dichloromethane as an eluent to afford the expected product 128 (43.6 mg) in 85% yield as amorphous solid: [α]D -5.1° (c = 0.75, CHCl3); IR: (Thin film, ν cm⁻¹): 3469-3461 (br), 3067, 2956, 2925, 1735, 1594, 1529, 1451, 1370, 1254, 1121, 1038, 835, 716; (+)FAB-MS (glycerol) gave m/e (ion, relative intensity): 1289.4 ([M]⁺, 1.3%), 1110.3 ([M-
aglycon]⁺, 4.7%); ¹H-NMR (CDCl₃) δ (ppm): 8.09-7.13 (m, 19H, Aromatic), 6.40 (dd, 1H, Jαβ = 1.1, Jmax = 16.8 Hz, C=CH₂, trans), 6.20 (dd, 1H, Jαβ = 10.3 Hz, C(O)CH=), 5.75 (dd, 1H, C=CH₂, cis), 5.33 (dd, 1H, Jαβ,αα = 2.5, Jαβ,αα = 6.6 Hz, H-8"), 5.26 (dd, 1H, Jαβ,αα = 8.2 Hz, H-7"), 5.24 (d, 1H, Jαβ = 9.8 Hz, NH), 5.21 (dd, 1H, J1,2 = 9.3 Hz, H-2), 4.99 (dd, 1H, J5,6a = 1.9, Jαβ,αα = 12.1 Hz, H-6a), 4.97 (dd, 1H, J3α,4α = 11.5, J3α,4α = 4.6, Jαβ,αα = 10.0 Hz, H-4"), 4.77 (d, 1H, J1,2 = 10.0 Hz, H-1"), 4.74 (dd, 1H, J5,6a = 3.5, Jαβ,αα = 12.0 Hz, H-6a'), 4.56 (d, 1H, J1,2 = 7.9 Hz, H-1'), 4.50 (dd, 1H, J5,6a = 6.1 Hz, H-6b), 4.33 (dd, 1H, J5,6a = 8.8 Hz, H-6b'), 4.29 (dd, 1H, Jαβ,αα = 12.5 Hz, H-9a"), 4.13 (dd, Jαβ,αα = 3.4 Hz, H-3'), 4.11 (dd, 1H, Jαβ,αα = 1.6 Hz, H-6"), 3.97 (dd, 1H, J3,4 = 9.0 Hz, H-3), 3.94-3.82 (m, 5H, H-5, H-5', H-3', H-5", H-9b"), 3.76 (d, 1H, J2,3 = 9.4 Hz, H-2'), 3.69 (dd, 1H, J3,4≤1.0, J4,5 = 9.0 Hz, H-4), 3.69 (dd, 1H, H-4'), 2.67 (dd, 1H, J3,4≤1.0 = 4.6, Jαβ,αα = 13.0 Hz, H-3e), 2.12, 2.05, 2.01, 1.93, 1.88 (5s, 5x Ac); ¹³C-NMR (CDCl₃) δ (ppm): 170.8, 170.5, 170.3, 170.2 (2C), (OCOCH₃, NCOCH₃) 168.1(C-1"), 166.6, 166.1, 165.3 (PhCO), 134.5-128.4 (26C, aromatic C, CH=CH₂), 104.4 (C-1'), 97.5 (C-

**Para-Nitrophenyl (5-acetamido-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosyl acid)-(2→3)-β-D-galactopyranosyl)-(1→4)-1-thio-β-D-glucopyranoside 130**

To a methanolic solution (3 mL) containing 122 (50 mg, 0.04 mmol) was added sodium methoxide (1.0 M) until the pH of the reaction mixture became ca. 8.5. The reaction mixture was stirred for 3 hours at room temperature. To this mixture was added 350 µL of 1.0 M NaOH solution and stirring was continued for additional 8 hours. TLC (15 % water/acetonitrile) showed complete conversion of the starting material (R_f = 0.93) to product (R_f = 0.23). The mixture was then neutralized with H⁺ resin (IR 120) and filtered. The filtrate and washings were combined and concentrated under reduced pressure. The resulting residue was then purified by radial silica gel chromatography (10 % water/acetonitrile) to afford 130 (29.7 mg) in 95% yield as an amorphous mass: [α]D: -60.1° (c = 0.88, water); IR: (Thin film, νcm⁻¹): 3395, 2929, 1704, 1610, 1515, 1393, 1342, 1222, 1064; (+)FAB-MS (glycerol) gave m/e (ion, relative intensity): 793.2 ([M+1]⁺, 1.6 %), 638.2 ([M-HSPnO₂⁺], 0.6 %); ¹H-NMR (500 MHz, D₂O) δ (ppm): 8.28 (d, 2H, J_ortho = 7.1 Hz, H-mata), 7.70 (d, 2H, H-ortho), 5.16 (d, 1H, J_1,2 = 9.9 Hz, H-1), 4.64 (d, 1H, J_1,2 = 7.9 Hz, H-1'), 4.20 (dd, J_2,3 = 3.1 Hz, H-3'), -3.74 (H-4''), 3.67 (d, 1H, J_2,3 = 9.7 Hz, H-2'), 3.62 (dd, 1H, J_2,3 = 8.5 Hz, H-2), 2.85 (dd, 1H, J_3e',4e' = 4.6, J_3e',3e' = 12.5 Hz, H-3e), 2.12 (s, NHAc), 1.89 (t, J_3e',4e' = 11.7 Hz, H-3a); ¹³C-NMR (125.8 MHz, D₂O) δ (ppm): 174.6 (NCOCH₃), 173.4 (C-1''), 145.6 (C-ipso), 142.8 (C-para), 128.7 (C-mata), 123.7 (C-ortho), 102.2 (C-1''), 99.4 (C-2''), 85.1 (C-1), 78.4 (C-4), 77.4 (C-5'), 75.3 (C-3'), 75.1 (C-5), 74.8 (C-3), 72.5 (C-6''), 71.3 (C-8''), 71.0 (C-2), 68.9 (C-2'), 67.9

217
Para-N-Acrylamidophenyl (5-Acetamido-3,5-dideoxy-D-glycero-α-D-galacto-2-
nonulopyranosylonic acid)-(2→3)-β-D-galactopyranosyl)-(1→4)-1-thio-β-D-
glucopyranoside 131

To a solution of 130 (52 mg, 0.066 mmol) in 3 mL of methanol-acetic acid (5:3)
was added Zinc dust (12 mg). The mixture stirred for 3 hours at room temperature. TLC
(15% water/acetonitrile) showed reduction of the nitro group into amine (Rf = 0.21).
Triethylamine was added to neutralize the reaction mixture. The reaction mixture was
filtered and concentrated under vacuum to dryness. The crude product was dissolved in
methanol (3 mL). To the solution was added triethylamine and the pH of the reaction
mixture was adjusted to ca. 8.0. The solution was then cooled to 0°C and 800 μL of
acyrloyl chloride in dry THF (1% v/v) was added at 0°C over a five minute period. The
solution was stirred at room temperature for 1 hour and an additional 8.6 μL of acryloyl
chloride was added. The progress of the reaction was monitored by TLC (15 %
water/acetonitril). After 3 hours, TLC showed that complete conversion of the amine to
acrylamide was achieved. The solution was concentrated under vacuum to dryness. The
residual mass was purified by radial silica gel chromatography (1 mm) using a gradient of
5%-15% water in acetonitrile. Compound 131 (47 mg) was obtained as amorphous solid.
The total yield for the two steps was 83%: [α]D -68.2° (c = 0.80, water); (+)FAB-MS
(glycerol) gave m/e (ion, relative intensity): 817.3 [(M+1+Na)+, 2.0 %]; 1H-NMR (500
MHz, D2O) δ (ppm): 7.68 (d, 2H, Jα,α' = 8.7 Hz, H-meta), 7.59 (d, 2H, H-ortho), 6.50

Copoly (Para-N-Acrylamidophenyl (5-acetamido-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosyl acid)-(2→3)-β-D-galactopyranosyl)-(1→4)-1-thio-β-D-glucopyranoside) 132

Method A:

GM$_3$ derivative 131 (8.4 mg, 10.6 μmol) and acrylamide (7.4 mg, 106 μmol) were dissolved in deoxygenated water (250 μL) obtained by multiple cool-thaw cycles and bubbling nitrogen. A small amount of (NH$_4$)$_2$S$_2$O$_8$ (0.1 mg, 0.424 μmol) was added by injecting of 20 μl of stock solution 10 mg/200 μl in water. The reaction mixture was stirred 90 °C for 15 min. TLC (MeOH/CH$_2$Cl$_2$, 1:1 in v/v) showed no monomer left. The reaction mixture was diluted with water (1 mL) and dialyzed (2,000 MW cutoff) against multiple 1 L volumes of distilled water. Lyophilization gave 9 mg (57%) of GM$_3$ glycopolymers 132 as a sponge solid. The GM$_3$ monomer incorporation in the glycopolymers was 1:11 which was determined using $^1$H NMR (D$_2$O) spectroscopy. In a parallel manner, GM$_3$ glycopolymers with ratios of monomer to acrylamide 1:5, 1:27, 1:48 were prepared with load ratio of 1:5, 1:20, 1:30 respectively in 50-70 % yields.

Method B:

GM$_3$ derivative 131 (14 mg, 10.86 μmol) and acrylamide (7.7 mg, 108.6 μmol) were dissolved in 250 μL of DMSO in screw-capped test tube and the solution was frozen and degassed three times under reduced pressure by placing the tube in a dry ice-acetone bath. The vial was sealed with Teflon tape. The reaction mixture was then warmed 45 °C
and injected with 37 \( \mu \text{L} \) of a 10 mg/mL solution of AIBN (2.7 mol %). The polymerization was left to proceed at 45 °C for 3 hours. The solution was then diluted with 1 mL of DMSO. Lyophilization gave 21 mg of spongy solid. Zemplén deacetylation and saponification was done by adding 150 \( \mu \text{L} \) of 1M NaOMe/MeOH to the crude product in 2 mL methanol-DMSO (1:1) and the resulting mixture was stirred for 12 hours at room temperature. 1 M NaOH (300 \( \mu \text{L} \)) was then added to the mixture which was stirred for an additional 18 hours at room temperature, neutralized with Amberlite IR-120 (H\(^+\)) resin and filtered. The resin was washed with methanol, and the combined filtrates and washings were concentrated under reduced pressure. To residue was then added 1 mL of water and the solution was dialyzed (2,000 MW cutoff) exhaustively against distilled water. The aqueous solution of the polymer was lyophilized to afford GM\(_3\)-S-CPA 132 (9.8 mg) in 61% yield as a white spongy solid: \(^1\)H NMR (D\(_2\)O) analysis gave a 1/10.3 molar ratio of GM\(_3\)/acrylamide incorporation in glycopolymer.

\(^1\)H-NMR \( \delta \) (500 MHz, D\(_2\)O): 7.62 (br, H-meta), 7.55 (br, H-ortho), 4.83 (d, 1H, \( J_{1,2} = 9.2 \) Hz, H-1), 4.60 (d, 1H, \( J_{1,2} = 7.1 \) Hz, H-1'), 4.18 (1H, H-3'), 4.03 (1H, H-4'), 3.97-3.62 (m, 16H), 3.43 (1H, H-2), 2.83 (dd, 1H, \( J_{3c',3c} = 3.7 \) Hz, \( J_{3c',3c} = 11.3 \) Hz, H-3c), 2.40-2.12 (br, methine of backbone), 2.10 (s, NHAc), 2.06-1.71 (methylene of backbone).\(^13\)C-NMR (125.8 MHz, D\(_2\)O), \( \delta \) (ppm): 179.1 (br, NHAc of backbone), 174.6 (NCOCH\(_3\)), 173.5 (C-1''), 132.4 (br, C-ortho), 121.6 (br, C-meta), 102.2 (C-1'), 88.9 (C-2''), 86.9 (C-1), 78.3 (C-4), 77.5 (C-5'), 75.4 (C-5), 75.1 (C-3'), 74.4 (C-3), 72.5 (C-6''), 71.4 (C-8''), 71.0 (C-2), 69.0 (C-2'), 68.0 (C-4''), 67.7 (C-7''), 67.1 (C-4'), 62.2 (C-9'), 60.6 (C-6'), 59.7 (C-6), 51.3 (C-5'), 43.2-41.3 (br, methine of backbone), 39.2 (C-3''), 36.4-34.2 (br, methylenes of backbone), 21.67 (CH\(_3\) of NHAc).
N-(3-thioacetyl) propanamidophenyl O-(methyl 5-acetamido-4,7,8,9-tera-O-acetyl-3,5-dideoxy-D-glycero-D-galacto-2-nonulopyranosylate)-(2→3)-O-(6-O-benzoyl-D-galactopyranosyl)-(1→4)-2,6-di-O-benzoyl-1-thio-D-glucopyranoside 133

To an ethyl acetate solution (1.5 mL) containing 128 (50 mg, 38.8 μmol) was added thioacetic acid (3.5 μL) at room temperature. To the reaction mixture was added triethylamine from a stock solution (1M in ethyl acetate) to adjust the pH to ca 8.0. The reaction mixture was stirred under N₂ atmosphere for 5 hours at room temperature. TLC (5% ethanol in dichloromethane) showed a completion of reaction. The reaction mixture was concentrated to dryness under reduced pressure and the residue was subjected to silica gel chromatography (2% ethanol in dichloromethane) to give compound 133 (22.14 mg) in 84% yield: m.p. 129-131°C; [α]D = -4.4° (c = 0.74, CHCl₃); IR: (Thin film, νcm⁻¹): 3471,3459 br, 3065, 2956, 2926, 1743, 1728, 1693, 1527, 1494, 1450, 1370, 1274, 1227, 1121, 1070, 1039, 834, 713; (+)FAB-MS (glycerol) gave m/e (ion, relative intensity): 2731.6 (2xM⁺, 2.6%), 1365.4 (M⁺, 5.7%), 1110.5 (M⁺-aglycon, 7.4 %); ¹H-NMR δ (CDCl₃): 8.08-7.24 (m, 19H, Aromatic), 5.33 (ddd, 1H, J₈α,₉β = 2.5, J₈β,₉δ = 6.6 Hz, H-6’’), 5.26 (dd, 1H, J₇₅,₆’’ = 8.1 Hz, H-7’’), 5.20 (dd, 1H, J₅,₂’’ = 9.3 Hz, H-2’’), 4.99-4.94 (m, 2H, H-6a, H-4’’), 4.76 (d, 1H, J₁,₂ =10.1 Hz, H-1’’), 4.73 (dd, 1H, J₅,₆α = 3.7 Hz, J₆α,₆δ =12.1 Hz, H-6a’’), 4.56 (d, 1H, J₁,₂ =7.9 Hz, H-1’), 4.50 (dd, 1H, J₅,₆β = 6.3 J₆β,₆δ = 11.9 Hz, H-6b), 4.34 (dd, 1H, J₅,₆δ =7.1 Hz, H-6b’’), 4.29 (dd, 1H, J₆α,₆β = 12.5 Hz, H-9a’’), 4.14 (dd, J₂,₄’’ = 3.3 Hz, H-3’’), 4.12 (dd, 1H, J₄’’,₇α = 1.7 Hz, H-6’’), 3.97 (dd, 1H, J₃,₄ = 8.9 Hz, H-3), 3.93-3.84 (m, 4H, H-5, H-5’, H-5’’, H-9b’’), 3.77 (s, 3H, OCH₃), 3.77 (d, 1H, J₂,₃’’ = 10.4 Hz, H-2’’), 3.69-3.6 (m, 2H, H-4, H-4’’), 3.19 (t, 2H, J = 6.9 Hz, SCH₂), 2.67 (dd, 1H, J₅,₄’’ = 4.7, J₅,₃α’’ = 13.0 Hz, H-3e), 2.64 (t, 2H, J = 6.9 Hz, CH₂CO), 2.33 (s, 3H, SAc), 2.13, 2.06, 2.02, 1.93, 1.88 (5s, 15 H, NHAc, OAc); ¹³C-NMR (CDCl₃), δ (ppm): 170.8, 170.5,170.2, 170.2 (5C, OCOCH₃, NCOCH₃) 168.6 (SAc), 168.1 (C-1’’), 166.6, 166.1, 165.3 (PhCO), 134.4-119.8 (24C, aromatic C), 104.4 (C-1’’), 97.5 (C-2’’), 85.9 (C-1), 82.2 (C-4), 76.6 (C-5, C-3’’), 76.4 (C-3), 75.0 (C-6’’), 73.0 (C-5’’), 72.9 (C-2),

Anal Calcd for (C₆₄H₇₂O₂₇N₂S₂): C, 56.30, H, 5.32, N, 2.05. Found: C, 55.55; H, 5.39; N, 2.07.

**Agar gel double radial diffusion assays**

Double radial diffusion assays were performed on 1% (w/v) agarose (BDH) containing 2% polyethylene glycol (PEG, molecular weight 8000, Sigma) in 0.1 M phosphate-buffered saline (PBS) pH = 7.2. Both glycopolymers and lectins were used at concentrations of 1 mg/mL in PBS. Aliquots (20 µL) of the respective polymer antigens and lectins were used to fill the wells perforated in the agarose gel slabs (= 1 mm thickness). Precipitin bands were allowed to form overnight at 4°C.

Chapter 6 Synthesis of Lewis X and Sulfated Lewis X  
Oligosaccharide as Selectin Ligands

6.1 Introduction

Sialyl Lewis X (SLexe), a terminal tetrasaccharide (α-Neu5Ac-(2→3)-β-D-Gal-(1→4)-[ α-L-Fuc-(1→3)]β-GlcNAc) of cell-surface glycoproteins and glycolipids, is a ligand for the endothelial leukocyte adhesion molecule-1 (ELAM-1), which mediates the early stage of adhesion of leukocytes to activated endothelial cells. Given the connection of ELAM-1 to leucocytes and its role in their recruitment to inflammation sites, SLexe is emerging as an important biological tool and potential agent for the treatment of inflammation and related disorders. Furthermore, the carbohydrate fragment of SLexe is found to be a tumor-associated oligosaccharide and, thus, it may serve as a marker for tumor cell targeting.

Recently, Feizi and co-workers reported the isolation of an equimolar mixture of sulfated Le¹ and Le* trisaccharides derived from an ovarian cystadenoma glycoprotein that binds more strongly to L-Selectin than to Le¹ and Le*. The sulfo-Le¹ not only is a ligand of selectins but also shows substantially greater binding activity for selectins than SLexe epitope. Owing to the biological importance of these ligands in cell-adhesion processes, coupled with difficulties associated with their isolation from natural sources, their efficient chemical syntheses are in demand.

In oligosaccharide synthesis, two aspects have to be mastered. The first is stereoselectivity or, preferably, stereospecific glycosylation. The second one concerns protecting group manipulation in order to make sure that only specific hydroxyl groups

are glycosylated. Normally this means that all hydroxy groups not to be glycosylated have to be suitably protected. This in turn tends to make synthetic paths lengthy and time-consuming. One of the major breakthroughs in new strategies for oligosaccharide synthesis has been the use of "lightly protected" acceptors, i.e. acceptors where there are several OH groups unprotected, especially near the position at which one wishes the glycosidic bond to be formed. This "open" glycosylation, in which two or several hydroxyl groups are free and in which one hydroxyl group is preferentially glycosylated in the presence of the other(s) may offer shorter routes to oligosaccharide synthesis.

Previous synthetic strategies for sialyl \( \text{Le}^\alpha \) and sufo-\( \text{Le}^\alpha \) epitopes are first syntheses of the \( \text{Le}^\alpha \) trisaccharide building block. 4-O-Unprotected N-acetylglucosamine acceptor was first allowed to react with galactosyl donors and then, after 3-O-deprotection, a fucosyl residue was attached to give the \( \text{Le}^\alpha \) trisaccharide building block. Our synthetic strategy of sialyl \( \text{Le}^\alpha \) and sufo-\( \text{Le}^\alpha \) led us to design an efficient glycosylation route to access \( \text{Le}^\alpha \) family. A selectively 6-O-TBDPS protected N-acetylglicosamine derivative 136 was used as key acceptor. Regiosselective introduction of the galactosyl moiety allowed us to easily access the key intermediate N-acetylactosamine building block. Subsequent fucosylation should give the \( \text{Le}^\alpha \) trisaccharides. Thus, the \( \text{Le}^\alpha \) trisaccharides can now be easily constructed with a short route from synthons derived from D-galactose, N-acetyl glucosamine and L-fucose respectively.

Scheme 6.1  Structure and Retrosynthetic Disconnection of Sialyl \( \text{Le}^x \) and 3'-O-Sulfate \( \text{Le}^x \)
6.2 Result and discussion

6.2.1 Preparation of “Lightly” Protected Glycosyl Acceptors

For the synthesis of Le" trisaccharide, the first step was the synthesis of N-acetyllactosamine building block. Compound 135b was selected as the key acceptor in the first glycosylation step. This compound was obtained from acetochloro N-acetylglucosamine \(^{245}\) in three steps as showed in scheme 6.2.

\[
\text{Scheme 6.2 Preparation of N-Acetyl Glucosamine Acceptors}
\]

(i) PTC: EtOAc / sat. NaHCO\(_3\), TBAHS, r.t., 2 h; 94%; (ii) NaOMe / MeOH, quantitative; (iii) TBDPSCI (1.5 equiv.), pyridine, r.t., 3 h, 92%; (iv) 1.5 equiv. BzCl, Pyridine: CH\(_2\)Cl\(_2\), 1:2; -50 \(^{\circ}\)C, 80.5%

Acetochloro N-acetylglucosamine 3 was treated with sodium azide under PTC conditions\(^{58}\) to give glycosyl azide 134 which was purified by crystallization from ethanol to give 134 in 94% yield. The azide 134 has a \(\beta - \alpha\) \(^{1}\)H NMR \(\text{spectroscopy (H-1 at } \delta 4.74 \text{ ppm, J}_{1,2} = 9.3 \text{ Hz). Subsequent Zemplén deacetylation and selective silylation of OH-6 with TBDPSCI in pyridine gave azide acceptor 135b in 88% overall yield. This facile chemistry allowed us to prepare the key acceptor 135b in large scale without any difficulty. Another glycosyl acceptor 136 could be obtained in similar

\(^{245}\) Chapter one of this thesis.
fashion except that a selective 6-O-benzoylation was executed under kinetically controlled conditions (-55°C) and afforded 6-O-benzoylated acceptor 136 in 81% yield. The location of the 6-O-benzoyl group in 136 was verified by 1H NMR spectroscopy. The primary H-6 protons appeared at low field δ 4.56-4.36 ppm, indicating that the benzoylation had occurred at OH-6.

### 6.2.2 Preparation of Galactosyl Donors

As discussed in Chapter 3.3, galactosyl donor 137 (Scheme 6.3) was easily available by a simple one pot, two step reaction from phenyl thiogalactoside 46. Thus successive treatment of triol 46 with tert-butylidiphenylsilyl chloride (1.2 equiv.) and benzoyl chloride (3.6 equiv.) in dry pyridine gave galactosyl donor 137 in 92% overall yield. In contrast, starting from the same starting material 46, four steps were needed to obtain galactosyl donor 143. Triol 46 was first treated with benzaldehyde dimethyl acetal in dry acetonitrile under acid catalysis (p-TsOH) to give acetal 140 in 90% yield. Subsequent benzoylation with benzoyl chloride in dry pyridine gave compound 141 in 97% yield. The treatment of benzylidene acetal 141 with NaCNBH₃ and HClEt₂O (obtained by bubbling hydrogen chloride gas into a diethyl ether solution for 25 min) gave galactosyl derivative 142 in 84% yield. Finally, treatment of 142 with benzoyl chloride in pyridine again finished the preparation of galactosyl donor 143.
Scheme 6.3 Synthesis of Galactopyranosyl Donors

The reductive benzylidene ring opening of 141 is worthy of additional comments. It was found that the benzylidene ring opening was very slow and incomplete if the reaction system was under basic or neutral conditions. Enough hydrogen chloride should be added to keep the pH of the solution at approximately 5. The ring opening reaction was very fast (usually finished in 10 min) and highly regioselective and the benzoyl groups are compatible under these acidic conditions. Quite surprisingly, the Rf of the ring opened product 142 with a 4-OH free was higher than that of the fully protected precursor 141 using 2% methanol in dichloromethane as eluent. The regioselectivity of the ring opening of 4,6-benzylidene acetal was confirmed by $^1$H-NMR spectroscopy, in a $^1$H-$^1$H COSY spectrum of 142, a coupling of H-4 with 4-OH was observed indicating that the free OH was at C-4 rather than at C-6. Furthermore, after benzylation, the strong downfield shift
for the H-4 signal at δ 5.94 ppm (Δδ = +1.54 ppm) in 143 confirmed the regiochemistry of the benzylidene ring opening reaction.

6.2.3 Synthesis of N-Acetyllactosamine, a Key Building Block for the Synthesis of Le\(^x\) Family

With suitable glycosyl donors and acceptors in hand, condensation of diol acceptor 135b with donor 137 (Scheme 6.4) was performed in dichloromethane in the presence of NIS/TfOH at -30 °C. The reaction afforded the desired β-(1→4)-linked disaccharide 138 in 82% yield. Very impressively, no β-(1→3)-linked regioisomer was detected during this coupling reaction. Disaccharide 138 is an important acceptor for the synthesis of Lewis x derivatives.

![Scheme 6.4 Regioselective Synthesis of N-Acetyllactosamine Derivative 138](image)

The β-configuration of the disaccharide 138 was deduced from the \(^1\)H-NMR spectrum which showed H-1' as a doublet at δ 5.06 ppm (J\(_{1',2'}\) = 8.0 Hz). The regiochemistry of the newly introduced glycosidic linkage of 138 was proved by converting 138 to its corresponding acetylated (Py-Ac\(_2\)O) derivative 139 which showed H-3 at δ 4.98 ppm (dd, J\(_{3,4}\) = 9.2 Hz, Δδ = +1.04 ppm) as a deshielded signal in its \(^1\)H-NMR spectrum. As examples, the \(^1\)H-NMR, \(^1\)H-\(^1\)H COSY, \(^13\)C-NMR, HMQC spectra of 138 are given in Figures 6.1 and 6.2.
Figure 6.1  $^1$H-NMR and $^1$H-.$^1$H COSY Spectra (500 MHz, CDCl$_3$) of 138
Figure 6.2 $^{13}$C-NMR and $^1$H-$^{13}$C-HMQC Spectra (125.7 MHz, CDCl$_3$) of 138
The regioselectivity of this glycosylation reaction was remarkably high as compared with results reported by Ogawa's group\textsuperscript{246} and very recently by Sinaỳ's group.\textsuperscript{247} In these cases both the $\beta(1\rightarrow4)$ and $\beta(1\rightarrow3)$ linked disaccharides were obtained in 61 and 17\% yield by Ogawa's group, while Sinaỳ \textit{et al.}\textsuperscript{247} obtained $\beta(1\rightarrow4)$ and $\beta(1\rightarrow3)$ linked disaccharide in a 2:1 ratio (Scheme 6.5).

![Glycosylation Reaction](image)

\textbf{Scheme 6.5} Observed Regioselectivity in the Glycosylation of GlcNAc Derivatives. Above (Ogawa et al.), below (Sinaỳ at al.)

We first reasoned that the steric effect of the tert-butyldiphenylsilyl protecting groups played a key role in the outcome of the regioselective glycosylation. The very bulky protecting 6-O-TBDPS groups on both the glycosyl donor 137 and acceptor 136 play a crucial role.

may have contributed to the remarkable regioselectivity. To test this hypothesis, a similar glycosylation reaction between the glycosyl donor 142 with a less bulky 6-O-benzyl protecting group and acceptor 136 was conducted (Scheme 6.6).

![Scheme 6.6 Regioselective Synthesis of N-Acetyllactosamine 144](image)

To our surprise, again, a remarkable regioselective outcome was obtained. The β(1→4) linked product 144 was obtained in 78% yield and no β(1→3) coupling product was detected during the reaction. The only by-product isolated from the reaction mixture was the elimination product 143a. Following these observations it seemed that the bulky 6-O-TBDPS protecting group in acceptor 136 played the crucial role for the high regioselectivity.

![143a](image)

### 6.2.4 Synthesis of Le\textsuperscript{x} trisaccharide

Having the key glycosyl acceptor 138, the crucial coupling with ethyl 2,3,4-tri-O-benzyl-1-thio-β-L-fucopyranoside 93 was attempted (Scheme 6.7). The glycosylation conditions and results are given in Table 6.1.

$^a$: Determined by individual isomer separation.
$^c$: The equivalents of promoters were calculated on the basis of the donor used.

Given the poor solubility of NIS in dichloromethane, a solvent mixture of acetonitrile-dichloromethane (5:1, v/v) was used in our first attempt. The coupling reaction was conducted with NIS/TfOH at -45°C. After routine work up, the reaction afforded two compounds in a ratio of 2:3. The chromatographically faster-moving component proved to be the desired α-glycoside $^{148}$α (Rf = 0.35) and the slow-moving
component was the β-isomer 148β (Rf = 0.32). This α,β anomer mixture was successfully separated by radial silica gel chromatography. Unfortunately, the desired trisaccharide 148α was obtained in only 26% yield and the β anomer in 37% yield. It should be mentioned that extensive elimination of the very reactive fucosyl donor 93 into 93b was observed during the glycosylation process. Because of this side reaction, the L-fucosyl donor was consumed without coupling, as two equivalents of donor 93 were added, about 15% of unreacted glycosyl acceptor could be recovered. Further addition of the glycosyl donor during the glycosylation reaction did not have dramatic effect on the results.

These results could be explained by a solvent participating mechanism\(^\text{248}\) as illustrated in Scheme 6.8 below.

![Scheme 6.8 Possible Mechanism for the Solvent Mediated Glycosylation Process](image.png)

In the mechanism shown in Scheme 6.8, formation of an α-nitriilium species, followed by an S_N2 displacement at the anomeric center provides the β anomer, while a β-nitriilium species gives the α anomer.

The configurations of the newly introduced anomeric centers in 148α and 148β were unambiguously assigned from these 1H NMR spectra. The anomeric proton H-1'' appeared as a doublet at δ 4.71 ppm (J_1''-2'' = 7.6 Hz) for 148β and at δ 5.25 ppm (J_1''-2'' = 3.5 Hz) for 148α. For comparison, the 1H NMR and COSY spectra of 148α, and 148β are illustrated in Figures 6.3 and 6.4.

A dramatic improvement was achieved when the glycosylation reaction between 93 and 138 was executed in a non-participating solvent system (benzene-dichloromethane; 5:1, v/v) using the milder DMTST as catalyst at 0 °C (Entry 2 in table 6.1). The desired α-glycoside 148α was obtained in good yield (84%) and no β-anomer 148β was observed under the glycosylation conditions.

In another similar glycosylation reaction, peracetylated phenyl 1-thio-β-L-fucopyranoside was used as donor which could be readily prepared as described in Scheme 6.9. Acetobromofucose was treated with thiophenol under PTC conditions as we described in Section 2.2 to afford phenyl 2,3,4-tri-O-acetyl-1-thio-β-L-fucopyranoside 146 in quantitative yield. The β-configuration of 146 was assigned from the 1H-NMR spectrum which showed H-1 as a doublet at δ 4.68 ppm (J_{1,2} = 10.0 Hz). Simple Zemplén deacetylation and routine benzylaation afforded 147 in 90% yield.

Figure 6.3  \(^1\text{H-}N\text{MR and }^{1}\text{H-}^{1}\text{H COSY Spectra (500 MHz, CDCl}_3\text{) of 148α.}
Figure 6.4  $^1$H-NMR and $^1$H-$^1$H-COSY Spectra (500 MHz, CDCl$_3$) of 148β
Condensation of phenyl 2,3,4-tri-O-benzyl-1-thio-β-L-fucopyranoside 147 with N-acetyllactosamine acceptor 144 (Scheme 6.10) under condition similar to that in table 6.1 entry 2 afforded trisaccharide 149 in good yield (86%). Again, no β-trisaccharide anomer was detected during the reaction. The successful introduction of the L-fucosyl unit was confirmed from the 1H NMR data of 149 which showed the H-1” signal at δ 5.30 ppm ($J_{1,2} = 2.3$ Hz).

![Scheme 6.10 Synthesis of Le^\text{a} Trisaccharide 149](image)

**6.2.5 Synthesis of Sulfo-Le^\text{a} and Sialyl Le^\text{a}**

Le^\text{a} trisaccharide 148 and 149 were evaluated as potential acceptors for the preparation of sulfo-Le^\text{a} and sialyl-Le^\text{a}. The benzoyl protecting groups of Le^\text{a} trisaccharides 148 and 149 were removed routinely (NaOMe-MeOH-CH$_2$Cl$_2$) to give trisaccharides 150 and 151 in almost quantitative yield. However, the removal of 6'- and 6-O-TBDPS protecting groups from trisaccharide 150 was not as easy as expected using the well established fluoride-anion treatment. Reacting 150 with an excess of tetrabutylammonium fluoride under reflux for 5 hours gave a monodesilylated product (as judged by NMR spectroscopy). In contrast, if 148 was treated under the same condition as
described above, silyl group removal was relatively easier and afforded the expected trisaccharide 152 in 81% yield.

**Scheme 6.11 Preparation of Le⁵ Derivatives**
(i) NaOMe, MeOH, r.t. quantitative; (ii) same as (i); (iii) TBAF, THF, reflux, 5 h, 86%.

One of the original goals of this research was to prepare sulfated Le⁵. Sulfations of sugars are usually performed with sulfuric acid, chlorosulfuric acid or sulfuryl chloride which generally gives complex mixtures. On the other hand, the use of sulfur trioxide complexes with pyridine or tertiary amines in solvents such as pyridine or N,N-dimethylformamide gave generally good yields of sulfation, provided that only the hydroxyl groups to be sulfated are unprotected in the starting material. The regioselectivity is usually poor, except that of primary alcohol.²⁴⁹ The regioselectivity in sugar chemistry is often solved using the well-known stannylene methodology discussed in Section 4.2.2. More recently, a chemical synthesis of sulfated Le⁵ using stannylene

mediated method were reported by Lubineau *et al.* 250 Our synthesis of sulfated Le\(^\text{\textdegree}\) is illustrated in Scheme 6.12.

![Scheme 6.12 Preparation of 3'-O-Sulfated Lewis\(^\text{\textdegree}\)](image)

(i) Bu\(_2\)SnO, toluene, reflux, 14 h; (ii) SO\(_3\)NMe\(_2\), THF-pyridine (1:1), 24 h, r.t., 91%

Le\(^\text{\textdegree}\) trisaccharide 150 having three secondary unprotected hydroxyl groups at C-2, C-3 and C-4 was first treated with dibutyltin oxide (1.3 equiv.) in toluene by refluxing under nitrogen for 14 hours. Evaporation of toluene and addition of SO\(_3\)NMe\(_2\) (2 equiv.) in a 1:1 tetrahydrofuran-pyridine mixture at room temperature for 24 hours gave 3’-O-sulfate 153 in 91% yield. The successful introduction of the sulfo-group was confirmed by FAB-MS which gave a molecular ion (m/z 1380.54, [M]+, 0.4%). Sulfo-Le\(^\text{\textdegree}\) 153 has been fully characterized by NMR using \(^1\text{H}-^1\text{H}\) COSY and \(^1\text{H}-^{13}\text{C}\) HMBC experiments. In particular, the C-3’ signal of sulfated Le\(^\text{\textdegree}\) 153 was found at \(\delta\) 80.7 ppm, 7.1 ppm downfield compared with that of the signal of C-3’ in Le\(^\text{\textdegree}\) trisaccharide 150 observed at \(\delta\) 73.6 ppm, showing unambiguously the presence of the sulfate on O-3 of the galactose moiety.

Our attention was turned to the preparation of the next target: the sialyl Le\(^\text{\textdegree}\) tetrasaccharide. The first attempts at the condensation of sialyl donor 12 with Le\(^\text{\textdegree}\) trisaccharide 150 in propionitrile-dichloromethane (5:1, v/v) using NIS/TfOH as promoter

(-60 °C) gave no trace of condensation product. Instead, a sizable cleavage of the α-L-fucopyranosyl residue from the Le⁴ acceptor moiety was observed. A similar phenomena was also recently observed by Matta's group.²⁵¹ Using DMTST as a promoter was equally frustrating. Despite a large number of attempts, no desired condensation between sialyl donor 12 and Le⁴ trisaccharide 150 occurred. Instead, sialic acid glycal and hemiacetal were consistently obtained from the reaction mixture. Steric mismatch was assumed to be the cause. The bulky 6,6'-bis(O-TBDPS) ethers were probably responsible for the steric hindrance. In another synthesis of sialyl Le⁴ reported by Danishefsky et al.,³⁸⁹ a similar synthetic strategy was applied. Although they also prepared 6,6'-O-disilylated Le⁴ trisaccharide, they did not use this derivative as a glycosyl acceptor with sialyl acid. Instead, they used a 6-O-TBDPS-6'-O-Bn Le⁴ as glycosyl acceptor. The authors have not commented this choice. To eliminate the possibility of steric hindrance, replacement of the 6'-O-TBDPS group with 6'-O-Bn was taken as an alternative. To this end, Le⁴ trisaccharide 149 was synthesized as described in section 6.3.5.

Scheme 6.13  Coupling Sialyl Donor 12 with Le⁴ Trisaccharide 150

Glycosyl donors are also important for successful coupling reactions. It was reported²⁵² that the use of perbenzoylated phenyl thiosialyl donor gave better glycosylation results than those from peracetylated sialyl donors. To test this point, we

prepared perbenzoylated sialyl donor 154 prepared quantitatively by a simple Zemplén deacetylation and benzoylation of 12.

A crucial coupling of the sialyl donor 154 and Le\(^x\) trisaccharide acceptor 151 was performed in a mixture of propionitrile and dichloromethane (5:1) containing 4Å molecular sieves using DMTST as promoter. Promising results were obtained, the predicted sialyl Le\(^x\) tetrasaccharide 155 was obtained in 47% purified yield (Scheme 6.14).

Successful introduction of a sialic acid moiety into the Le\(^x\) trisaccharide was confirmed by NMR and mass spectroscopic evidences. These include the signals of sialyl acid in the \(^1\)H-NMR spectra at \(\delta\) 2.76 ppm (dd, \(J_{3c,4} = 4.9, J_{3c,3a} = 13.1\) Hz) for H-3e, 2.27 ppm (dd, \(J_{3a,4} = 11.4, Hz\)) for H-3a, 3.21 ppm (s) for OMe and the \(^{13}\)C-NMR singals at 168.6 ppm for C=O (C-1) and 62.4 ppm for C-3. Positive ion FABMS corresponding to the tetrasaccharide fragment at \(m/z\) 1728.4 ([M-N\(_2\)-Bz]\(^+\), 16.2%) was observed.

Scheme 6.14 Synthesis of Sialyl Le\(^x\) 155
6.3 Conclusion

A very efficient synthetic route towards Le\(^{4}\) trisaccharide family was developed. This work demonstrates an efficient synthesis of an N-acetyllactosamine donor, as a key building block for further transformation to Le\(^{4}\) trisaccharide. This procedure takes advantage of a 6-O-TBDPS protected N-acetylgalactosamine derivative, allowing the introduction of a galactosyl moiety with high regioselectivity. In addition, the fucosyl moiety could be introduced to the N-acetyllactosamine building block in a stereocontrolled manner even without anchimeric group participation. Facile chemistry allowed us to prepare Le\(^{4}\) trisaccharide in large scale without difficulty.

Regioselective introduction of the sulfate group and sialic acid residues onto Le\(^{4}\) afforded important sulfo-Le\(^{4}\) and sialyl Le\(^{4}\) oligosaccharides as selectin ligands. Further development of these important oligosaccharides to multivalent glycoconjugates is currently being pursued in this laboratory.

6.4 Experimental Methods

2-Acetamido-3,4,6 tri-O-acetyl-2-deoxy-\(\beta\)-D-glucopyranosyl azide 134

To a solution of acetochloro N-acetylgalactosamine 3 (1.0 g, 2.73 mmol), TBAHS (1.39 g, 4.10 mmol) and sodium azide (0.89 g, 13.65 mmol) in methylene chloride (10 mL) was added saturated aqueous NaHCO\(_3\) (10 mL). The two phase reaction mixture was vigorously stirred at room temperature for 2 hours. TLC (benzene/acetone, 1:1 v/v) indicated complete transformation of the halide 3 (Rf = 0.65) to product 134 (Rf = 0.60). EtOAc (60 mL) was added, the organic phase was separated and successively washed with sat. NaHCO\(_3\), water (2x) and sat. NaCl. The combined extracts were dried (Na\(_2\)SO\(_4\)), filtered and evaporated under reduced pressure to give essentially pure 134 (0.94 g) in 94 % yield as judged by \(^1\)H NMR spectroscopy. Compound 134 was crystallized from ethanol: m.p. 159.2-161.3 °C; [\(\alpha\)]\(_D\)
-45.7° (c = 0.9, CHCl₃); CI-MS (ether) gave m/z (ion, relative intensity): 373.4 ([M+1]+, 45.3%), 329.9 ([M+1-N₃], 100%); ¹H-NMR (CDCl₃) δ (ppm): 5.77 (1H, NH), 5.23 (dd, 1H, J₃,₄ = 9.8 Hz, H-3), 5.07 (dd, 1H, J₄,₅ = 9.6 Hz, H-4), 4.74 (d, 1H, J₁,₂ = 9.3 Hz, H-1), 4.24 (dd, 1H, J₆a,₆b = 12.5 Hz, H-6a), 4.13 (dd, 1H, J₅,₆b = 2.4 Hz, H-6b), 3.92 (dd, 1H, J₂,₃ = 10.1 Hz, H-2), 3.72 (ddd, 1H, J₅,₆b = 4.7 Hz, H-5), 2.07, 2.02, 2.01, 1.96 (OAc, NHAc). ¹³C-NMR δ (CDCl₃); 171.1, 170.7 (2C), 170.4 (2C) 169.2 (6 C=O), 88.3 (C-1), 73.8 (C-5), 72.0 (C-3), 68.1 (C-4), 61.8 (C-6), 53.9 (C-2), 23.0 (NHAc), 20.6, 20.4, 20.3 (OAc).

2-Acetamido-6-O-tert-butylidiphenylsilyl-2-deoxy-β-D-glucopyranosyl azide 135b

To a cold solution of 2-acetamido-2-deoxy-β-D-glucopyranosyl azido 135a (1.7 g, 6.9 mmol) in dry pyridine (20 mL), tert-butylchlorodiphenylsilane (2.1 mL, 8.2 mmol) was added in one portion. The mixture was stirred for 3 hours at room temperature and poured onto ice water, extracted with dichloromethane, and washed with saturated sodium hydrogen carbonate. The organic extract was dried (Na₂SO₄) and concentrated. The crude product was subjected to column chromatography (methanol-methylene chloride, 1:10) to give pure 135b as a foamy solid (3.08 g) in 92 % yield: [α]D -53.6° (c = 1.0, CHCl₃); IR (thin film, νcm⁻¹): 3329, 3073, 2938, 2858, 2116 (N₃), 1652, 1553, 1428, 1375, 1313, 1092, 942, 823, 704; (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 485.0 ([M]+, 6.2 %), 440.5 ([M-N₃]+, 100 %); ¹H-NMR (500 MHz, CDCl₃) δ (ppm): 7.34-7.67 (m, 10H, aromatic); 6.14 (d, 1H, J₂,₂NH = 7.1 Hz, NH), 4.61 (d, 1H, J₁,₂ = 9.1 Hz, H-1), 3.88 (m, 2H, H-6, H-6'), 3.66 (dd, 1H, J₃,₄ = 9.4 Hz, H-3), 3.60 (dd, 1H, J₄,₅ = 9.1 Hz, H-4), 3.53 (dd, 1H, J₂,₃ = 9.1 Hz, H-2), 3.44 (dd, 1H, J₅,₆a = 4.3, J₅,₆b = 4.5 Hz, H-5), 2.02 (s, 3H, NHAc), 1.02 (s, 9H, SiCMe₃); ¹³C-NMR (125.7 MHz, CDCl₃) δ (ppm): 125.7 172.2 (C=O, NHAc), 135.6-127.8 (12C, aromatic), 88.0 (C-1), 77.5 (C-5), 74.8 (C-3), 71.7 (C-5), 63.7 (C-6), 56.5 (C-2), 26.8 (3C, SiCMe₃), 23.5 (NHAc), 19.3 (SiCMe₃).

2-Acetamido-6-O-benzoyl-2-deoxy-β-D-glucopyranosyl azide 136

To a suspension of 134 (1.0 g, 2.68 mmol) in 50 mL of methanol was added 350 μL of 1 M NaOMe (pH = 9-10). The mixture was stirred at room temperature for 35 min. TLC (1/4, Ethanol/CH₂Cl₂) showed that Zemplén deacetylation was finished. The solution was neutralized with H⁺ resin (Dowex 50W-X8) filtered, concentrated under reduced pressure and coevaporated with pyridine two times. The residue was dissolved in dry pyrine/CH₂Cl₂, 1:2 v/v. The solution was cooled to -55 °C and benzoyl chloride (0.45 mL) in 10 mL of dichloromethane was added drop by drop in a period of 30 min. The reaction mixture was stirred under nitrogen at -55 °C for additional 15 min. TLC (EtOAc/CH₂Cl₂, 1:4) indicated that the starting material (Rf = 0.17) was completely consumed. To this mixture was added methanol (1.5 mL) and the solution was stirred for an additional 30 min. The crude product obtained after evaporation was chromatographed on silica gel (EtOAc/CH₂Cl₂, 1:6). The titled compound (755 mg) was obtained in 80% yield as a white solid: m.p. 226-228 °C; [α]D₉ -30.3° (c = 1.0, CH₃OH); (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 351.15 ([M+1], 30.1 %), 308.13 ([M-N₃]+, 20.4 %); ¹H-NMR (DMSO-d₆) δ (ppm): 5.49 (1H, OH), 5.21 (1H, OH), 4.56 (dd, 1H, J₅,₆ = 2.8, J₆,₇ = 12.0 Hz, H-6a), 4.49 (d, 1H, J₁₁,₁₂ = 10.3 Hz, H-1), 4.36 (dd, 1H, J₅,₆ = 5.7 Hz H-6b), 3.69-3.43 (m, 4H, H-2, H-3, H-4, H-5) 1.83 (s, 3 H, NHAc); ¹³C-NMR (DMSO-d₆) δ (ppm): 170.7 (2C), 170.0 (C=O, NHAc) 165.7 (C=O, Bz), 132.3-128.7 (6C, Aromatic), 88.6 (C-1), 76.1 (C-5), 73.8 (C-3), 70.0 (C-4), 63.9 (C-6), 55.0 (C-2), 23.1 (NHAc).

Phenyl 2,3,4-tri-O-benzoyl-6-O-tert-butyldiphenylsilyl-1-thio-β-D-galactopyranoside 137

To a cooled (ice bath) solution of phenyl 1-thio-β-D-galactopyranoside 64 (3.3 g, 12.1 mmol) in dry pyridine (15 mL) was added TBDPSCI (3.5 mL, 13.3 mmol). The reaction mixture was then allowed to reach room temperature. The stirring was continued for 4 hours, after which time TLC showed complete conversion of 64 to silylated
intermediate 136. The mixture was cooled to 0°C, and benzoyl chloride (5.0 mL, 44 mmol) was added. The mixture was stirred at room temperature for an additional 5 hours and then poured onto ice. The solution was then extracted with chloroform. The extracts were collected and washed with saturated sodium bicarbonate and brine. The solution was dried over sodium sulfate and evaporated to dryness under reduced pressure. The product was purified by silica gel chromatography using ethyl acetate/hexane (1:4, v/v) as eluent to give 137 (9.2 g) in 92% yield: [α]D +110° (c = 1.0, CHCl₃); M.S. (C.I. ether) (m/z): 688.9 ([M+H]+, 3.6%), 579.1 ([M+1-SPh]+, 100 %); ¹H-NMR (500 MHz, CDCl₃) δ (ppm): 7.98-7.14 (m, 30H, aromatic), 6.06 (dd, 1H, J₄,₅ < 1.0 Hz, H-4), 5.66 (dd, 1H, J₁,₂ = 9.8 Hz, H-2), 5.60 (dd, 1H, J₃,₄ = 3.1 Hz, H-3), 4.98 (d, 1H, J₁,₂ = 9.8 Hz, H-1), 4.14 (m, 1H, H₅), 3.90 (dd, 1H, J₅,₆a = 6.1, J₆a,₆b = 10.3 Hz, H-6a), 3.79 (dd, 1H, J₅,₆b = 7.6 Hz, H-6b), 1.02 (s, 9H, SiMe₃); ¹³C-NMR (125.7 MHz, CDCl₃) δ (ppm): 165.6, 165.2, 165.1 (C=O, 3xBz), 85.7 (C-1), 77.8 (C-5), 73.4 (C-3), 68.1 (C-4), 68.1 (C-2), 61.6 (C-6), 26.7 (3c, SiCMe₃), 19.1(SiCMe₃).

Phenyl 4,6-O-benzylidene-1-thio-β-D-galactopyranoside 140

Phenyl 1-thio-β-D-galactopyranoside (201 mg, 0.74 mmol) in acetonitrile (2 mL) was heated at 60 °C until the starting material was completely dissolved. The solution was then cooled to room temperature, benzaldehyde dimethyl acetal (0.33 mL, 2.2 mmol) and p-toluenesulfonic acid monohydrate (catalytic amount) were then added. The mixture was stirred for 4 hours at room temperature, neutralized with triethylamine and concentrated under reduced pressure. The residue was then purified by column chromatography (MeOH/CH₂Cl₂, 1:10) on silica gel to give 140 (234 mg) in 90% yield: [α]D -24.0° (c = 1.0, CHCl₃); M.S.(C.I. ether) (m/z): 361.0 ([M+H]+, 54.5 %), 250.9 ([M+1-SPh]+, 100 %); ¹H-NMR (CDCl₃) δ (ppm): 7.70-7.10 (m, 10H, 2xPh), 5.41 (s, 1H, PhCH), 4.39 (d, 1H, J₁,₂ = 9.2 Hz, H-1), 4.29 (dd, 1H, J₅,₆a = 1.4, J₆a,₆b = 12.4 Hz, H-6), 4.11 (d, 1H, J₃,₄ < 1.0 Hz, H-4), 3.94 (dd, 1H, J₅,₆b = 1.7 Hz, H-6b), 3.58 (m, 2H, H-2, H-3), 3.46 (1H, H-5).

Phenyl 2,3-di-O-benzoyl-4,6-O-benzylidene-1-thio-β-D-galactopyranoside 141

Phenyl 4,6-benzylidene-1-thio-β-D-galactopyranoside 140 (1.00 g, 2.8 mmol) was dissolved in 15 mL of dry pyridine. The solution was cooled to 0 °C and benzoyl chloride (1.62 mL, 7 mmol) was added slowly. The mixture was then stirred for overnight. TLC showed a complete conversion starting material to product. 1 mL of methanol was added stirred for additional 15 min. The mixture was concentrated under reduced pressure. Column chromatography (ethyl acetate/Hexane, 1:1) of the residue on silica gel gave 141 (1.54 g) in 97% yield: [α]_D +54.9° (c = 1.0, CHCl₃); M.S.(C.I. ether) (m/z): 368.7 ([M]⁺, 1.7 %), 459.2 ([M+1-SPh]⁺, 100 %); ¹H-NMR (CDCl₃) δ (ppm): 7.95-7.10 (m, 20H, 4Ph), 5.66 (t, 1H, J₂,₃ = 10.0 Hz, H-2), 5.41 (s, 1H, PhCH), 5.22 (dd, 1H, J₃,₄ = 3.2 Hz, H-3), 4.84 (d, 1H, J₁,₂ = 9.7 Hz, H-1), 4.50 (d, 1H, J₄,₅ <1.0 Hz, H-4), 3.87 (dd, 2H, H-6a, H-6b), 3.67 (1H, H-5).

Phenyl 2,3-di-O-benzoyl-6-O-benzyl-1-thio-β-D-galactopyranoside 142

To a solution of 141 (2.0 g, 3.52 mmol) in dry THF (20 mL) was added powdered molecular sieves 4 Å (1.2 g). The mixture was stirred for 2 hours at room temperature and sodium cyanoborohydride (3.0 g, 47.7 mmol) was gradually added. After the reagent had dissolved, saturated solution of hydrogen chloride in ether (obtained by bubbling HCl gas in ether for 25 min) was added dropwise at room temperature until the evolution of gas ceased. TLC (EtOAc/Hexane 2:3) indicated that starting material 141 (Rf = 0.46) was cleanly converted to product 142 (Rf = 0.54) after 10 min. The mixture was diluted with dichloromethane, filtered, washed with saturated sodium hydrogen carbonate and water, dried (Na₂SO₄), and concentrated. Column chromatography on silica gel using ethyl acetate-hexane (1:3) as a eluent gave 142 (1.7 g) in 84% yield: [α]_D +77.0° (c = 1.0 CHCl₃); (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 571.3 ([M+1]⁺, 4.3 %), 440.5 ([M-SPh]⁺, 82.5 %); ¹H-NMR (500 MHz, CDCl₃) δ (ppm): 7.99-7.20 (m, 20H, aromatic), 5.75 (dd, 1H, J₂,₃ = 9.8 Hz, H-2), 5.29 (dd, 1H, J₃,₄ = 3.2 Hz, H-3), 4.91 (d, 1H,
$J_{1,2} = 9.9$ Hz, H-1), 4.56 (AB pattern, 2H, CH$_2$Ph), 4.41 (dd, 1H, $J_{3,4} = 3.2$, $J_{4,OH} = 1.4$ Hz, $J_{4,5} < 1.0$ Hz, H-4), 3.91-3.83 (m, 3H, H5, H-6a, H-6b), 2.67 (d, 1H, $J_{4,OH} = 1.4$ Hz, OH); $^{13}$C-NMR (125.7 MHz, CDCl$_3$) $\delta$ (ppm): 165.3, 165.8 (C=O, 2xBz), 86.7 (C-1), 77.3 (C-5), 75.5 (C-3), 73.9 (CH$_2$), 69.6 (C-6), 68.4 (C-4), 68.0 (C-2).

**Phenyl 2,3,4-tri-O-benzoyl-6-O-benzyl-1-thio-β-D-galactopyranoside 143**

Compound 143 was treated as described for the synthesis of 142. Column chromatography (1%, methanol-dichloromethane) of the residue on silica gel gave 142 (651mg) in 97% yield as an amorphous mass: $[\alpha]_D +113.5^\circ$ (c, 1.0, CHCl$_3$); (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 675.2 ([M+1]$^+$, 0.5%), 565.2 ([M+1]$^+$, 5.2%);

$^1$H-NMR (500 MHz, CDCl$_3$) $\delta$ (ppm) 7.19-7.96 (m, 25H, aromatic), 5.94 (dd, 1H, $J_{4,5} < 1.0$ Hz, H-4), 5.68 (dd, 1H, $J_{2,2} = 9.9$ Hz, H-2), 5.53 (dd, 1H, $J_{3,4} = 3.0$ Hz, H-3), 4.98 (d, 1H, $J_{1,2} = 9.9$ Hz, H-1), 4.52 (AB pattern, 1H, $J = 11.8$ Hz, H-A of CH$_2$Ph), 4.45 (AB pattern, 1H, H-B of CH$_2$Ph), 4.19 (m, 1H, H-5), 3.73 (dd, 1H, $J_{5,6a} = 6.3$, $J_{6a,6b} = 9.8$ Hz, H-6a), 3.62 (dd, 1H, $J_{5,6b} = 6.3$ Hz, H-6b); $^{13}$C-NMR (125.7 MHz, CDCl$_3$) $\delta$ (ppm) 165.5, 165.3, 165.2 (C=O, 3xBz), 85.7 (C-1), 76.7 (C-5), 73.7 (CH$_2$), 73.2 (C-3), 68.6 (C-4), 68.2 (C-6), 68.0 (C-2).

Anal. Calcd. For C$_{40}$H$_{34}$O$_5$S (674.20): C, 71.20; H, 5.08. found: C, 71.28; H, 4.96.

**O-(2,3,4-tri-O-benzoyl-6-O-tert-butyldiphenylsilyl-β-D-galactopyranosyl)-(1→4)-2-acetamido-6-O-tert-butyldiphenylsilyl-2-deoxy-β-D-glucopyranosyl azide 138**

Compound 135b (100 mg, 0.21 mmol, 1.0 eq) and 137 (203.6 mg, 0.25 mmol, 1.2 eq) was dissolved in dry dichloromethane (3 mL) under nitrogen and powdered molecular sieves (4 Å) was added. The mixture was stirred at room temperature for 30 min and then cooled to -30°C. N-Iodosuccinimide (92.7 mg, 0.41 mmol) and trifluoromethanesulfonic acid (11.7 μL, 0.6 eq) were added. The reaction was essentially complete (as judged by TLC) after 35 min. The mixture was then diluted with dichloromethane (10 mL) and filtered through celite. The filtrate was washed with 10% aqueous sodium thiosulfate (10
mL), saturated aqueous sodium bicarbonate (2x10 mL), and brine (10 mL). The solution was dried (Na₂SO₄) and concentrated to a foam that was chromatographed on silica gel (2% methanol in dichloromethane) to afford disaccharide 138 (202.6 mg) in 82% yield: m.p. 108-110 °C; [α]D +45.2° (c = 1.0, CHCl₃); IR (Thin film, ν/cm⁻¹): 3367, 3067, 2937, 2858, 2114, 1732, 1282, 1106, 814, 734, 706; FAB-MS (glycerol) gave m/z (ion, relative intensity): 1154.5 (M-HN₃)⁺, 3.2 %; ¹H-NMR (500 Hz, CDCl₃) δ (ppm): 7.99-7.10 (m, 35H, Aromatic H), 6.03 (d, 1H, J₄,₅ < 1.0 Hz, H-4'), 5.73 (dd, 1H, J₂,₃ = 10.5 Hz, H-2'), 5.61 (d, 1H, J₃,NH = 8.3, NH), 5.59 (dd, 1H, J₃,₄ = 3.3 Hz, H-3'), 5.06 (d, 1H, J₁,₂ = 8.0 Hz, H-1'), 4.70 (d, 1H, J₁,₂ = 9.2 Hz, H-1), 4.07 (m, 1H, H-5'), 4.04 (dd, 1H, J₄,₅ = 9.5 Hz, H-4), 3.94 (dd, 1H, J₃,₄ = 8.4 Hz, H-3), 3.88(dd, 1H, J₅,₆ = 6.3, J₆,₇ = 10.1 Hz, H-6a'), 3.82-3.76 (m, 2H, H-6b', H-6a), 3.74 (dd, 1H, J₅,₆ = 2.3, J₆,₇ = 11.6 Hz, H-6b), 3.54 (ddd, 1H, J₂,₃ = 9.4 Hz, H-2), 3.32 (1H, H-5), 1.98 (s, 3H, NH₃), 1.11 (s, 9H, tBu), 1.01 (s, 9H, tBu); ¹³C-NMR (125.8, CDCl₃) δ (ppm): 170.6, 165.4, 165.2, 165.3 (4x C=O), 135.9-127.7 (42C, Aromatic), 100.8 (C-1'), 87.7 (C-1), 77.9 (C-4), 76.7 (C-5),74.3 (C-5'), 71.6 (C-3'), 71.3 (C-3), 69.9 (C-2'), 67.6 (C-4'), 61.3 (C-6), 60.9 (C-6'), 56.4 (C-2), 27.0 (tBu), 26.7 (tBu), 23.5 (NH₃), 19.5 (Si-C), 19.0 (Si-C).

Anal. Calcd for C₇H₁₇N₃O₁₃Si₂ (1197.50): C, 67.20; H, 6.06; N, 4.68. Found: C, 66.46; H, 6.01; N, 4.71.
O-(2,3,4-tri-O-benzoyl-6-O-tert-butyldiphenylsilyl-β-D-galactopyranosyl)-(1→4)-2-acetamido-3-O-acetyl-6-O-tert-butyldiphenylsilyl-2-deoxy-β-D-glucopyranosyl azide 139

Compound 138 (200 mg, 0.167 mmol) was dissolved in pyridine (3 mL) and acetic anhydride (200 μL) was added at 0 °C. The reaction mixture was stirred at room temperature for 30 min. TLC (5% MeOH in CH₂Cl₂) showed that the acetylation was completed. Direct evaporation of the solvent under reduced pressure and coevaporation with toluene afforded crude product 139 which was subjected to chromatography purification (2% MeOH in CH₂Cl₂). Compound 139 (207 mg) was obtained quantitatively: m.p. [α]₂₅ +26.2° (c = CHCl₃); ¹H-NMR (CDCl₃) δ (ppm): 7.98-6.88 (m, 35H, Aromatic H), 6.07 (d, 1H, J₃,NH = 8.1, NH), 6.06 (d, 1H, J₄,₅ < 1.0 Hz, H-4'), 5.57 (dd, 1H, J₂,₂' = 10.4 Hz, H-2'), 5.46 (dd, 1H, J₅,₆' = 3.4 Hz, H-3'), 5.03 (d, 1H, J₁,₂ = 8.0 Hz, H-1'), 4.98 (dd, 1H, J₃,₄ = 9.2 Hz, H-3), 4.46 (d, 1H, J₁,₂ = 9.2 Hz, H-1), 4.25 (dd, 1H, J₄,₅ = 9.5 Hz, H-4), 4.06 (dd, 1H, J₂,₃ = 10.1 Hz, H-2), 3.96 (dd, 1H, J₅,₆ = 5.5, J₅,₆' = 8.8 Hz, H-5'), 3.78 (dd, 1H, J₆,₆' = 9.7 Hz, H-6a), 3.70 (dd, 1H, J₅,₆ = 1.4, J₆,₆' = 12.0 Hz, H-6a), 3.64 - 3.60 (m, 2H, H-6b', H-6b), 3.06 (1H, H-5), 1.96 (s, 3H, NHAc), 1.76 (s, 3H, OAc), 1.10 (s, 9H, tBu), 0.99 (s, 9H, tBu); ¹³C-NMR (CDCl₃) δ (ppm): 171.4, 170.2, 165.37, 165.1, 164.7 (5x C=O), 135.9-127.6 (42C, Aromatic), 99.7 (C-1'), 88.7 (C-1), 76.8 (C-5), 73.3 (C-5'), 73.0 (C-3), 72.6 (C-4), 71.9 (C-3'), 70.2 (C-2), 67.6 (C-4'), 60.8 (C-6'), 60.7 (C-6), 53.1 (C-2), 26.9 (tBu), 26.7 (tBu), 23.3 (NHAc), 20.73 (OAc), 19.4 (Si-C), 19.0 (Si-C).

O-(2,3,4-tri-O-benzoyl-6-O-benzyl-β-D-galactopyranosyl)-(1→4)-2-acetamido-6-O-tert-butyldiphenylsilyl-2-deoxy-β-D-glucopyranosyl azide 144

To a solution of 143 (181 mg, 0.268 mmol) and 2-acetamido-6-O-(tert-butyldiphenylsilyl)-2-deoxy-β-D-glucopyranosyl azide 136 (100 mg, 0.206 mmol) in 4 mL of acetonitrile and dichloromethane (1:1, v/v) was added powdered molecular sieves 4 Å
(200 mg). The mixture was stirred for 2 hours at room temperature, then cooled to -45 °C. NIS (94.5 mg, 0.42 mmol) and TfOH (8.5 μL, 0.161 mmol) were added and the reaction mixture was stirred for 45 min at -45° C. TLC (ethyl acetate-hexane, 1:1) showed complete reaction. The reaction mixture was diluted with 5 mL of dichloromethane, filtered and then washed with dichloromethane. The combined filtrate and washings were successively washed with 10% Na2S2O3 sat. NaHCO3, and brine. The dried (Na2SO4) solution was concentrated under reduced pressure. The syrup residue was purified by silica gel chromatography (ethyl acetate/hexane, 1:2) to give 144 (168 mg) in 78% yield as an amorphous mass: [α]D +56.5° (c = 1.0, CHCl3); (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 1049 ([M+1]+, 4.8 %); IR (Thin film, νcm⁻¹): 3390 (NH), 2936, 2865 (CH2), 2114 (N2), 1728, 1666 and 1267 (C=O), 1090 (C-O), 3066 and 713 (Ph); 1H-NMR (500 MHz, CDCl3) δ (ppm): 8.01-7.12 (m, 30H, aromatic), 5.91 (dd, 1H, J4',5' < 1.0 Hz, H-4'), 5.73 (dd, 1H, J5',6' = 10.5 Hz, H-2'), 5.57 (d, 1H, JNH2 = 8.1 Hz, NH), 5.51 (dd, 1H, J3',4' = 3.4 Hz, H-3'), 5.02 (d, 1H, J1,2 = 8.1 Hz, H-1'), 4.74 (d, 1H, J1,12 = 9.3 Hz, H-1), 4.52 (AB pattern, 1H, J = 11.8, H-A of CH2Ph), 4.40 (AB pattern, 1H, H-B of CH2Ph), 4.15 (dd, 1H, J5',6a' = 6.3, J5',6b' = 6.5 Hz, H-5'), 4.00-4.03 (m, 2H, H-5, H-4), 3.79 (dd, 1H, J6,6a = 1.4, J6a,6b = 11.8 Hz, H-6a), 3.71 (dd, 1H, J5,6b = 2.7 Hz, H-6b), 3.69 (dd, 1H, H-6a'), 3.61 (dd, 1H, J5',6b' = 6.5 Hz, H-6b'), 3.52 (dd, 1H, J2,3NH2 = 18.8 Hz, H-2), 3.36 (m, 1H, H5), 2.01 (s, 3H, AcHN), 1.06 (s, 9H, Me3Si); 13C-NMR (125.8 MHz, CDCl3) δ (ppm): 170.6 (C=O, AcO), 165.4, 165.4 and 165.1 (C=O, 3xBz), 127.8-137.2 (24C, aromatic), 100.9 (C-1'), 87.6 (C-1), 78.6 (C-3), 76.6 (C-5), 73.7 (CH2), 73.0 (C-5'), 71.6 (C-3'), 71.4 (C-4), 68.8 (C-2'), 68.1 (C-4'), 67.3 (C-6'), 61.5 (C-6), 56.5 (C-2), 26.9 [SiC(CH3)3], 23.6 (NHAc), 19.5 [SiC(CH3)3].

Anal. Calcd. For C58H60O13N4Si(1048.38): C, 66.39; H, 5.77; N, 5.34. found: C, 66.11; H, 5.68; N, 5.32.

Phenyl 2,3,4-tri-O-acetyl-1-thio-β-L-Fucopyranoside 146

To a solution of acetobromofucopyranose 145 (974 mg, 2.76 mmol), TBAHS (0.96 g, 2.76 mmol, 1 equiv.) and thiophenol (718 mg, 4.64 mmol) in ethyl acetate (10 mL) was added
saturated aqueous 1M Na₂CO₃ (10 mL). The two phase reaction mixture was vigorously stirred at room temperature for 2 hours. EtOAc (10 mL) was added, and the organic phase was separated and successively washed with sat. NaHCO₃, water (2x), and sat. NaCl. The combined extracts were dried (Na₂SO₄), filtered and evaporated under reduced pressure. The residue was purified by silica gel chromatography (EtOAc/Hexane 1:3) to provide pure 6 in 91% yield: [α]D₀ -9.6° (c = 1.0, CHCl₃); ¹H-NMR (CDCl₃) δ (ppm): 7.49-7.27 (m, 5H, Ph), 5.24 (dd, 1H, J₄₋₅ = 1.0 Hz, H-4), 5.20 (dd, 1H, J₁₋₂ = 10.0 Hz, H-2), 5.03 (dd, 1H, J₃₋₄ = 3.3 Hz, H-3), 4.68 (d, 1H, J₁₋₂ = 10.0 Hz, H-1), 3.80 (dq, 1H, J₅₋₆ = 6.4 Hz, H-5), 2.12, 2.06, 1.95 (s, Me, 3xOAc), 1.21 (d, 3H, H-6); ¹³C-NMR (CDCl₃) δ (ppm): 170.6, 170.1, 169.5 (3xOAc), 132.9 (C-ipsos), 132.4 (2C, C-ortho), 128.9 (2C, C-meta), 127.9 (C-para), 86.5 (C-1), 73.2 (C-5), 72.4 (C-3), 70.3 (C-4), 67.4 (C-2), 20.8, 20.6, 20.6 (s, 3xMe), 16.5 (C-6).

Phenyl 2,3,4-tri-O-benzyl-1-thio-β-L-fucopyranoside 147

To a methanolic solution (10 mL) of phenyl 2,3,4-tri-O-acetyl-1-thio-β-L-fucopyranoside 144 (1.2 g, 3.11 mmol) was added 1M of sodium methoxide solution in methanol until pH of the reaction mixture became 9. The de-O-acetylation was finished after 25 min. H⁺ Resin (IR 120) was added and the solution was stirred for an additional 5 min. The reaction mixture was filtered and concentrated under reduced pressure. The residue was dissolved in N,N-dimethylformamide (15 mL) containing benzyl bromide (1.2 mL). Sodium hydride (450 mg, 18.75 mmol) was added at 0°C and the resulting mixture was then stirred under nitrogen for 3 hours. Methanol (2 mL) was added to the reaction mixture to destroy excess sodium hydride. The mixture was extracted using toluene and iced water. The organic layer was washed with 5% HCl (10 mL), water and concentrated. The residue was purified by column chromatography (ethyl acetate-hexane, 6:1) to afford 145 (1.37 g) in 84% yield: IR (thin film, ν max): 3061, 3030, 2983, 2882, 1584, 1496, 1453, 1357, 1087, 872, 740, 697; M.S. (C.I. ether, m/z): 527.0 ([M+1]⁺, 2.1%), 416.9 ([M+1-PhSH]⁺, 13.8%); ¹H-NMR (500 MHz, CDCl₃) δ (ppm), 7.60-7.20 (m, 15H, 3xBn), 5.03-4.67 (6H, 3 AB pattern, 3xCH₂), 4.61 (d, 1H, J₁₋₂ = 9.7 Hz, H-1), 3.94 (dd, 1H, J₁₋₂ = 9.2 Hz, H-2), 3.64 (dd, 1H, J₄₋₅ < 1.0 Hz, H-4), 3.60 (dd, 1H, J₃₋₄ = 2.8 Hz, H-
3), 3.53 (dq, 1H, J_{5,6} = 6.4 Hz, H-5), 1.27 (d, H-6); $^{13}$C NMR (125.7 MHz, CDCl$_3$), δ (ppm): 138.8-127.0 (18C, 3xBn), 87.60 (C-1), 84.6 (C-3), 77.2 (C-2), 76.7 (C-4), 75.6 (CH$_2$), 74.7 (CH$_2$), 74.6 (C-5), 72.9 (CH$_2$), 17.3 (C-6).

Preparation of Le$^\alpha$ trisaccharide

Method A:

To a solution of 138 (100 mg, 0.0835 mmol) and ethyl 2,3,4-tri-O-benzyl-1-thio-$\alpha$-L-fucopyranose 93 (103 mg, 0.209 mmol) in 3 mL of CH$_3$CN/CH$_2$Cl$_2$ (5:1) was added powdered molecular sieves 4 Å (MS-4 Å; 150 mg). The mixture was stirred for 3 hours at room temperature. The reaction mixture was cooled to -45 °C, NIS (83.1 mg, 0.369 mmol) and TFOH (3.7 μL, 0.042 mmol) were added. The solution was stirred at -45 °C for 45 minutes. TLC showed complete conversion of the donor and gave two coupling products (Rf = 0.21 and Rf = 0.25, 2% methanol in dichloromethane). The reaction mixture was filtered through celite, and washed with dichloromethane. The combined filtrate and washings were washed with 10% sodium thiosulfate, saturated sodium bicarbonate and brine. It was then dried (Na$_2$SO$_4$) and concentrated to a syrup. After dissolution in the minimum volume of CH$_2$Cl$_2$, the mixture was successfully purified by radial silica gel chromatography using 1% MeOH-CH$_2$Cl$_2$ as eluent to give 148β anomer (44.1 mg) in 37% yield and 148α anomer (31.6 mg) in 26% yield.

Method B:

To a solution of 138 (100 mg, 0.0835 mmol) and ethyl 2,3,4-tri-O-benzyl-1-thio-$\alpha$-L-fucopyranoside 93 (60 mg, 0.125 mmol) in 5 mL of 5:1 benzene/dichloromethane was added powdered molecular sieves 4 Å (MS-4 Å; 100 mg). The mixture was stirred for 2 hours at room temperature. DMTST (70 mg, 0.324 mmol) and 4Å MS (50 mg) was added to the stirred mixture at 0 °C. After 1 hour, TLC (2% MeOH in CH$_2$Cl$_2$) showed complete conversion of the donor. Then triethylamine (100 μL) and methanol (200 μL) were added to the reaction mixture which was stirred for an additional 25 min. Routine
work up procedure afforded 148α (86.5 mg) in 78% yield as an amorphous mass which could be crystallized from isopropanol to give 148 rs needles. Traces of acceptor (17.6 mg) were recovered.

O-(2,3,4-Tri-O-benzoyl-6-O-tert-butylidiphenylsilyl-β-D-galactopyranosyl)-(1→4)-O-[(2,3,4-tri-O-benzyl α-L-fucopyranosyl)-(1→3)]-2-acetamido-6-O-tert-butylidiphenylsilyl-2-deoxy-β-D-glucopyranosyl azide 148α

Compound 148α had: [α]D -15.1° (c = 1.0, CHCl3); IR (Thin film, νcm⁻¹): 3068, 3032, 2935, 2859, 2114, 1733, 1675, 1601, 1532, 1495, 1453, 1428, 1281, 1262, 1102, 1068, 912, 824, 809, 736, 705; FAB-MS (glycerol) gave m/z (ion, relative intensity): 1571.7 ([M+1-N₂]⁺, 4.8%); ¹H-NMR (CDCl₃) δ (ppm): 8.04-6.82 (m, 50H, Aromatic H), 6.13 (dd, 1H, J₄',₅' = 0.9 Hz, H-4'), 5.95 (d, 1H, J₂,NH = 7.9 Hz, NH), 5.65 (dd, 1H, J₂,₃ = 10.5 Hz, H-2'), 5.59 (dd, 1H, J₃,₄ = 2.4 Hz, H-3'), 5.25 (d, 1H, J₁,₂ = 3.5 Hz, H-1''), 5.09 (d, 1H, J₁,² = 7.8 Hz, H-1'), 4.91-4.50 (4H, J = 11.2 Hz, 2 AB pattern, 2xCH₂), 4.42 (s, 2H, CH₂), 4.28 (d, 2H, J₁,₂ = 9.0 Hz, J₃',₄ = 6.7 Hz, H-1', H-5), 4.21 (dd, 1H, J₄,₅ = 8.0 Hz, H-4), 4.08 (dd, 1H, J₂,₃ = 10.2 Hz, H-2''), 4.02-3.95 (m, 2H, H-5', H-3), 3.90 (dd, 1H, J₅,a = 2.4, J₆,a = 11.7 Hz, H-6a), 3.86-3.84 (m, 2H, H-6a', H-6b'), 3.85-3.75 (m, 2H, H-6b, H-3''), 3.64 (dd, 1H, J₂,₃ = 9.0 Hz, H-2), 3.61 (d, 1H, J₄',₅' < 1.0 Hz, H-4), 3.04 (m, 1H, H-5), 1.76 (s, 3H, NHAc), 1.12 (s, 9H, Si(CH₃)₃), 1.07 (d, 3H, J₅',₆' = 6.6 Hz, H-6''), 0.95 (s, 9H, Si(CH₃)₃); ¹³C-NMR (CHCl₃) δ (ppm): 170.3, 165.5, 165.3, 165.2 (4xC=O, BzO, AcNH), 138.9 - 127.2 (60C, Aromatic), 99.59 (C-1'), 97.37 (C-1''), 88.13 (C-1), 79.8 (C-3), 78.3 (C-4''), 77.5 (2C, C-5, C-2''), 75.3 (CH₂), 75.1 (C-5'), 74.2 (CH₂), 73.7 (C-4), 73.5 (C-3'), 72.2 (CH₃), 71.6 (C-3'), 70.3 (C-2'), 67.5 (C-4), 67.0 (C-5''), 61.5 (C-6), 60.3 (C-6'), 55.2 (C-2), 26.9 (tBuSi), 26.6 (tBuSi), 23.2 (NHAc), 19.4 (Si-C), 18.9 (Si-C), 16.9 (C-6'').

O-(2,3,4-Tri-O-benzoyl-6-O-benzyl-β-D-galactopyranosyl)-(1→4)-O-{[(2,3,4-tri-O-
benzyl α-L-fucopyranosyl)-(1→3)]-2-acetamido-6-O-tert-butyldiphenylsilyl-2-deoxy-
β-D-glucopyranosyl azide 149

To a solution of 144 (80 mg, 0.076 mmol) and phenyl 2,3,4-tri-O-benzyl-1-thio-β-
L-fucopyranoside 147 (80.3 mg, 0.152 mmol) in benzene (3 mL) was added powdered
molecular sieves 4 Å (200 mg). The mixture was stirred for 2 hour at room temperature,
and cooled to 0 °C. To the cooled solution, dimethyl(methylthio)sulfonium triflate (98 mg, 0.38 mmol) was added and the reaction mixture was stirred under nitrogen atmosphere for 2 hours at 0 °C. The course of the reaction was monitored by TLC. After reaction completion, triethylamine (100 µL) and methanol (200 µL) were added and the mixture was stirred for an additional 25 min. The precipitates were filtered, and washed with dichloromethane. The filtrate and washings were combined, dried (Na₂SO₄), and concentrated to give a syrup which was chromatographed on silica gel using 1% methanol-dichloromethane to give 148 (96.7 mg) in 87% yield as an amorphous mass: \([\alpha]_D = -27.0^\circ\ (c = 1.0, \text{CHCl}_3)\); (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 1422.58 ([M-N₃]+, 1.8 %); IR (Thin film, \(v_{\text{cm}^{-1}}\)): 3323, 3064, 2906, 2114, 1733, 1675, 1452, 1267, 1101, 1068, 823.4, 738, 705; ¹H-NMR (500 MHz, CDCl₃) δ (ppm): 8.02-7.11 (m, 45H, 9 Ph), 5.93 (dd, 2H, \(J_{4',5'} = 1.4\ Hz, \text{H-4}', \text{NH}\)), 5.69 (dd, 1H, \(J_{2',3'} = 10.5\ Hz, \text{H-2}'\)), 5.51 (dd, 1H, \(J_{3',4'} = 3.4\ Hz, \text{H-3}'\)), 5.30 (d, 1H, \(J_{1',2'} = 2.3\ Hz, \text{H-1}'\)), 5.11 (d, 1H, \(J_{1,2} = 8.2\ Hz, \text{H-1}\)), 4.89-4.35 (4xAB pattern, 8H, 4xPhCH₂), 4.41 (1H, \(H-5''\)), 4.36 (d, 1H, \(H-1\)), 4.25 (dd, 1H, \(J_{4,5} = 8.2\ Hz, \text{H-4}\)), 4.12 (dd, 1H, \(J_{2,3} = 10.2\ Hz, \text{H-2}''\)), 4.06-3.99 (M, 2H, H-3, H-5), 3.93-3.81 (m, 3H, H-3', H-6a, H-6b), 3.70-3.62 (m, 4H, H2, H-4', H-6a', H-6b'), 3.08 (d, 1H, H-5), 1.79 (s, 3H, NHAc), 1.23 (d, 3H, \(J_{3,6} = 6.2\ Hz, \text{H-6}''\)), 1.11 (s, 9H, SiCMe₃); ¹³C NMR (125.7 MHz, CDCl₃) δ (ppm): 170.3 (C=O, OAc), 165.7, 165.3, 165.1 (4xC=O, γz), 135.9-127.7 (54C, aromatic), 99.7 (C-1'), 97.4 (C-1''), 88.1 (C-1), 79.9 (C-3''), 78.4 (4''), 77.5 (C-5), 77.3 (C-2''), 75.2 (CH₂), 74.8 (C-3), 74.1 (CH₂), 73.6 (C-4), 73.6 (CH₂), 72.6 (C-5''), 72.4 (CH₂), 71.6 (C-3'), 70.2 (C-2''), 68.3 (C-4'), 67.2 (C-6''), 67.1 (C-5''), 61.4 (C-6), 55.5 (C-2), 26.9 (SiCMe₃), 23.3 (NHAc), 19.5 [SiC(CH₃)₃], 17.0 (C-6'').

To a solution of Le$^3$ derivative 150 (100 mg, 0.0769 mmol) in toluene (3 mL) was added 23.5 mg (0.0923 mmol) of dibutylin oxide. The mixture was refluxed under nitrogen for 14 hours. The solution was concentrated under reduced pressure. The dry dibutylstannylene complex was treated with SO$_3$ NMe$_3$ (21.7 mg, 0.154 mmol) in 1:1 tetrahydrofuran-pyridine mixture (3 mL) at room temperature for 24 hours. The reaction mixture was then diluted with methanol (3 mL), filtered and concentrated under reduced pressure. The residue was purified on a radial silica gel plate (1 mm) using 6% to 15% methanol in dichloromethane as gradient eluent to give 153 (97.2 mg) in 92% yield: $R_f$ = 0.45 (MeOH/CH$_2$Cl$_2$, 1:8); m.p. 119-121 °C; [α]$_D$ = -30.2° (c = 1.5, CHCl$_3$); IR (Thin film, v$_{cm}^{-1}$): 3381, 3021, 2934, 2857, 2113, 1661, 1543, 1472, 1428, 1233, 1157, 1006, 1068, 991, 809, 751, 703; FAB-MS (glycerol) gave m/z (ion, relative intensity): 1380.2 ([M]+, 0.4 %); $^1$H-NMR (CDCl$_3$) δ (ppm): 7.71-6.97 (m, 35H, Aromatic H), 5.06 (d, 1H, J$_{1',2'}$ = 1.7 Hz, H-1''), 4.85 (d, 1H, J$_{1',3'}$ = 7.7 Hz, H-1''), 4.83 (d, 1H, J$_{1,2}$ = 8.6 Hz, H-1), 4.78, 4.42 (2H, J = 11.1, AB pattern, CH$_2$), 4.73, 4.61 (2H, J = 11.5 Hz, AB pattern, CH$_2$), 4.54 (d, 1H, J$_{4',5'}$ < 1.0 Hz, H-5''), 4.47 (d, 1H, J$_{4',5'}$ < 1.0 Hz, H-4''), 4.35 (dd, 1H, J$_{5',6'}$ = 3.0 Hz, H-3'), 4.34-4.16 (m, 4H, H-4, H-6a, CH$_2$), 4.11 (dd, 1H, J$_{3,4}$ = 9.1 Hz, H-3), 3.94-3.89 (m, 2H, H-2'', H-6a'), 3.97 (dd, 1H, J$_{5,5''}$ = 4.6 Hz, H-6b'), 3.97-3.75 (m, 1H, H-6b, H-2'''), 3.73 (dd, 1H, J$_{2,3'}$ = 9.8, J$_{3',4'}$ = 2.7 Hz, H-2'''), 3.56 (m, 1H, H-5'), 3.51 (1H, H-4''), 3.47 (1H, H-5), 2.90 (1H, H-2), 1.62 (s, 3H, NHAc), 1.04 (s, 9H, SiC(CH$_3$)$_3$), 1.03 (d, 3H, J$_{5',6'}$ = 6.5 Hz, H-6'''), 0.94 (s, 9H, SiC(CH$_3$)$_3$); $^{13}$C-NMR (CDCl$_3$) δ (ppm): 171.0 (C=O), 138.9-127.3 (42C, Aromatic), 100.3 (C-1'), 98.0 (C-1''), 87.9 (C-1), 80.7 (C-3'), 79.5 (C-3''), 77.8 (C-4''), 77.5 (C-5), 76.8 (C-2''), 76.0 (C-3), 75.2 (CH$_2$), 73.8 (CH$_2$), 73.7 (C-5'), 73.3 (C-4), 72.1 (CH$_2$), 70.5 (C-2'), 66.9 (C-5''), 66.4 (C-4''), 61.6 (C-6), 60.8 (C-6''), 50.8 (C-2), 26.8 (tBuSi), 26.7 (tBuSi), 23.2 (NHAc), 19.5 (Si-C), 19.1 (Si-C), 16.7 (C-6'').
Methyl (phenyl-5-acetamido-4,7,8,9-tetra-O-benzoyl-3,5-dideoxy-D-glycero-\(\alpha\)-D-galacto-2-thio-nonulopyranosid)onate 154

To a solution of methyl (phenyl-5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-D-glycero-\(\alpha\)-D-galacto-2-thio-nonulopyranosid)onate 12 (0.5 g , 0.86 mmol ) in 10 mL of methanol was added 1 M NaOMe until pH = 8.5. The reaction mixture was stirred for 25 min. The solution was evaporated under reduced pressure and coevaporated with dry pyridine (5 mL). The resulting dried compound was dissolved in dry pyridine (5 mL) and benzoyl chloride (0.55 mL, 4.8 mmol) was added at 0 °C. The reaction mixture was stirred at room temperature for 3 hours. The excess chloride was then quenched with ice water and the solution was extracted with methylene chloride (10 mLx2). The extracts were washed with sodium bicarbonate, water and brine. The Organic phase was dried (Na₂SO₄), filtered, and concentrated under reduced pressure. The residue was purified by silica gel chromatography using EtOAc/hexane (2:5) as eluent to give 154 (0.66 g) in 92 % yield; [\(\alpha\)]D: -18.2° (c = 1.0, CHCl₃); (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 832.3 ([M+1]+, 4.8%); \(^1\)H-NMR (CDCl₃) \(\delta\) (ppm): 8.09-7.27 (m, 25H, aromatic), 6.16 (d, 1H, J₅,₆H = 7.8 Hz, NH), 5.62 (ddd, 1H, J₈,₉a = 2.3, J₈,₉b = 4.8 Hz, H-8), 5.16 (ddd, 1H, J₃₄,₄ = 11.5, J₄₅,₅ = 10.5 Hz, H-4), 5.02 (dd, 1H, J₉,₉b = 12.3 Hz, H-9a), 4.73 (dd, 1H, J₈,₉b = 4.8 Hz, H-9b), 4.15 (dd, 1H, J₅,₆ = 10.3 Hz, H-5), 4.00 (dd, 1H, J₇,₈ = 8.5 Hz, H-7), 3.49 (dd, 1H, J₆,₇ = 1.3 Hz, H-6), 2.99 (dd, 1H, J₃₄,₄ = 4.7 Hz, H-3e), 2.83 (s, 3H, OCH₃), 2.18 (dd, 1H, J₃₄,₄ = 11.5, J₃₄,₃ = 12.5 Hz, H-3a), 1.90 (NHAc); \(^1^3\)C-NMR (CDCl₃) \(\delta\) (ppm): 172.8, 168.5, 167.7, 166.1, 165.0 (C=O), 136.5-128.3 (30C, aromatic), 87.9 (C-2), 76.7 (C-6), 71.2 (C-8), 69.7 (C-4), 67.7 (C-7), 63.6 (C-9), 52.2 (OCH₃), 52.1 (C-3), 37.9 (C-3), 23.0 (Me, NHAc).
O-(Methyl 5-acetamido-4,7,8,9-tetra-O-benzoyl-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosylonate)-(2→3)-O-(6-O-benzyl-β-D-galactopyranosyl)-(1→4)-O-[(2,3,4-tri-O-benzyl α-L-fucopyranosyl)-(1→3)]-2-acetamido-6-O-tert-butylidiphenylsilyl-2-deoxy-β-D-glucopyranosyl azide (SLe³) 155

To a solution of 151 (58 mg, 0.05 mmol) and methyl (phenyl 5-acetamido-4,7,8,9-tetra-O-benzoyl-3,5-dideoxy-D-glycero-α-D-galacto-2-thio-nonulopyranosid)onate 154 (104 mg, 0.125 mmol) in 3 mL dry propionitrile-dichloromethane (5:1) was added powdered molecular sieves 4 Å (200 mg). The mixture was stirred for 2 hours at room temperature, and cooled to -30°C. To the cooled solution, dimethyl(methylthio)sulfonium triflate (26 mg, 0.25 mmol) was added and the reaction mixture was stirred under nitrogen atmosphere for 2 hours at 0 °C. The progress of the reaction was monitored by TLC (EtOAc/Hexane 3:1). After reaction completion, triethylamine (50 µL) and methanol (100 µL) were added to the mixture. The mixture was then stirred for an additional 15 min and then filtered. The combined filtrates and washings were washed with water, dried (Na₂SO₄), and concentrated. Chromatography on silica gel using ethyl acetate/hexane (1:1) as eluent gave 155 (44.2 mg) in 47% yield as an amorphous mass: [α]D = -0.64° (c = 1.0, CHCl₃); (+)FAB-MS (glycerol) gave m/z (ion, relative intensity): 1728.38 [(M-N₃-Bz)⁺, 16.2 %]; ¹H-NMR (500 MHz, CDCl₃) δ (ppm): 8.17-7.18 (m, 50H, 10xPh), 6.25 (1H, d, J NH₅⁺ = 8.9 Hz, NH of Neu5Ac ), 6.12 (1H, d, J NH₂ = 7.2 Hz, NH of Glu), 5.69 (ddd, 1H, J₆,₉₈ = 2.5, J₆,₉₀ = 5.4, J₇,₈ = 9.1 Hz, H₈ of Neu5Ac), 5.17 (d, J₁,₂ = 3.5 Hz, H-1 of Fuc), 5.01-4.41 (3xAB pattern, 6H, 3xPhCH₂), 4.85 (d, J₁₂ = 7.7 Hz, H-1 of Gal), 4.82 (d, J₁₂ = 9.8 Hz, H-1 of GlcNAc); 4.68-4.57 (AB pattern, 2H, PhCH₂), 4.43 (dq, 1H, J₄,₅ = 6.0 Hz, H-5 of Fuc), 3.21 (s, 3H, OMe, Neu5Ac), 2.68 (dd, J₃e,₄ = 4.9, J₃e,₃a = 13.1 Hz, H-3e of Neu5Ac), 2.26 (t, 1H, J₃e,₄ = 11.4 Hz, H-3a), 1.94 (s, 3H, NHAc of Neu5Ac), 1.67 (s, 3H, NHAc of GlcNAc), 1.15 (d, 3H, H-6 of Fuc), 1.08 (s, 9H, Si(C(CH₃)₃); ¹³C NMR (125.7 MHz, CDCl₃): 8 172.9, 170.6 (C=O, NHAc), 168.6, 167.5, 166.1, 165.8, 165.0 (C=O, Bz), 138.9-125.5 (60C, Aromatic), 101.1 (C-1, Gal), 98.4 (C-1, Fuc), 98.1 (C-1, Glc), 87.9 (C-3, Fuc), 79.9 (C-4, Fuc), 87.9, 79.9, 77.8, 77.7, 76.1, 75.1, 74.6, 74.4, 73.3 (2C), 73.0, 72.6, 72.2, 70.5, 70.0, 69.3, 68.4 (C-6, Gal), 68.0, 67.3,
64.2 (C-9, Neu5Ac), 62.4 (C-6, Glc), 52.7 (OMe), 51.9 (C-5, Fuc), 37.0, 27.0 [3C, SiC(CH₂)₃], 23.2 (Me, NAc), 23.0 (Me, NAc), 19.5 (Si-C).
Conclusions

The research presented in this thesis has demonstrated the feasibility and generality of the “active-latent” glycosylation strategy in oligosaccharide synthesis including biologically important sialosides and glycoconjugates.

To demonstrate the generality of this new glycosylation strategy, an extensive amount of glycosylation reactions using various thioglycosyl donors and acceptors were conducted. The potential usefulness of the “latent” nature of the nitro group was nicely illustrated by the chemoselective glycosylation of partially benzoylated para-nitrophenyl thioglycosides with “active” thioglycosyl donors using NIS/TfOH as promoter. The results discussed in this thesis clearly indicate that NIS/TfOH is a valuable promoter for the chemoselective glycosylation of “latent” acceptors with “active” thioglycosyl donors. Furthermore, our studies also revealed that the amount of triflic acid used was crucial for the selective activation of an “active” thioglycoside over a relatively “latent” thioglycoside.

The combination of “active-latent” and “armed-disarmed” glycosidation methodologies, i.e. changing the electron donating and withdrawing abilities of the substituents on the thiophenyl ring and the protecting groups at the C-2 position, could expand the relative reactivities of glycosyl donors or acceptors and thus widen the scope of this glycosylation strategy. This new strategy is clearly advantageous for the syntheses of complex oligosaccharides.

The “active-latent” glycosylation strategy was successfully extended to the synthesis of sialosides. Because the formation of the sialic acid glycosyl linkage with other sugar moieties is hindered electronically as well as sterically by the presence of the geminal carboxylate group, formation of this type of bond is a true test of the utility of a given method of glycosylation. After careful optimization of reaction conditions, the NIS/TfOH promoted glycosylation of an “active” α-thiosialoside of Neu5Ac over a “latent” p-nitrophenyl thioglycosyl acceptor was achieved. GM₃ trisaccharide and GM₃ related sialosides have been synthesized in good yields.
An advantage of using “active-latent” glycosylation strategy to prepare a GM₃ sialoside over other methodologies is that the GM₃ trisaccharide prepared can be easily transformed back into an “active” form ready for further coupling to other sugar moieties. In addition, the nitro group on the thiophenyl ring of GM₃ trisaccharides could be quantitatively reduced to amino group which allows the introduction of an acryloyl group or other optional spacers to develop GM₃ glycopolymers and or glycoconjugates.

GM₃ and lactose-containing glycopolymers, with different incorporation ratios, were prepared by copolymerization of GM₃ and lactosyl monomers with acrylamide. Qualitative double immunodiffusion assays were conducted for evaluation of the interaction between the glycopolymers and the corresponding lectins and showed selective bindings.

Finally, a very efficient synthetic route to the sialyl Le⁴ was developed. Remarkable regioselectivity in the glycosylation reaction between a galactosyl donors and a N-acetylglucosamine acceptor allowed us to synthesize N-acetyl-lactosamine in a very convergent way. Stereocntroled introduction of a fucosyl moiety to the N-acetyl-lactosamine acceptor provided to the important Le⁴ trisaccharide. After removal of the protecting groups of the galactosyl moiety of Le⁴, a sulfate group or sialic acid moiety was regioselectively introduced to complete the synthesis of 3-O-sulfo-Le⁴ and sialyl Le⁴ respectively.

In order for complex oligosaccharide conjugates to become useful in therapeutic industry, much more work remains to be done in their practical syntheses. In addition, the preparation of dendritic Le⁴, 3-O-sulfo Le⁴ and sialyl Le⁴ generates much scientific and industrial interests. The research along this line is being actively pursued in this laboratory.
Claims to Original Research

Novel Synthetic methodology:

Development of “active-latent” glycosylation strategy for the synthesis of complex oligosaccharides and glycoconjugates.

 Development of phase transfer catalyzed procedure for the efficient synthesis of different type of glycosyl derivatives: aryl and alkyl diolates, xanthates, cyanates and N-hydroxysuccinimides.

 Development of improved procedure for the synthesis of important partially projected glycosyl acceptor para-nitrophenyl O-(2,6-di-O-benzoyl-β-D-galactopyranosyl)-(1→4)-1-thio-β-D-glucopyranoside 113.

 Development of efficient synthesis of Lewisª and 3′-sulfate Lewisª and sialyl Lewisª. High regioselectivities were obtained during the preparation of N-acetyllactosamine derivatives.

Important oligosaccharides and glycoconjugates:

Para-Nitrophenyl O-(methyl 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosylate)-(2→6)-2,3,4-tri-O-benzoyl-1-thio-α-D-galactopyranoside 102

Para-Nitrophenyl O-(methyl 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosylate)-(2→3)-O-(6-O-benzoyl-β-D-galactopyranosyl)-(1→4)-2,6-di-O-benzoyl-1-thio-β-D-glucopyranoside 122

Para-Nitrophenyl O-(methyl 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosylate)-(2→3)-6-O-benzoyl-β-D-galactopyranosyl-(1→4)-[(2,3,4-tri-O-benzyl-α-L-fucopyranosyl)-(1→3)]-2,6-di-O-benzoyl-1-thio-β-D-glucopyranoside 123
N-(3-thioacetyl) propanamidophenyl O-(methyl 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosylate)-(2→3)-O-(6-O-benzoyl-β-D-galactopyranosyl)-(1→4)-2,6-di-O-benzoyl-1-thio-β-D-glucopyranoside 133

Copoly (Para-N-Acrylamiódophenyl (5-acetamido-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosylonic acid)-(2→3)-β-D-galactopyranosyl)-(1→4)-1-thio-β-D-glucopyranoside) 132

O-(6-O-Benzyl-β-D-galactopyranosyl)-(1→4)-O-[(2,3,4-tri-O-benzyl-α-L-fucopyranosyl)-(1→3)]-2-acetamido-6-O-tert-butyldiphenylsilyl-2-deoxy-β-D-glucopyranosyl azide 151

O-(6-O-tert-butyldiphenylsilyl-3-O-sulfo-β-D-galactopyranosyl)-(1→4)-O-[(2,3,4-tri-O-benzyl-α-L-fucopyranosyl)-(1→3)]-2-acetamido-6-O-tert-butyldiphenylsilyl-2-deoxy-β-D-glucopyranosyl azide 153 (Le⁺-3′-O-Sulfate)

O-(Methyl 5-acetamido-4,7,8,9-tetra-O-benzoyl-3,5-dideoxy-D-glycero-α-D-galacto-2-nonulopyranosylonate)-(2→3)-O-(6-O-benzyl-β-D-galactopyranosyl)-(1→4)-O-[(2,3,4-tri-O-benzyl-α-L-fucopyranosyl)-(1→3)]-2-acetamido-6-O-tert-butyldiphenylsilyl-2-deoxy-β-D-glucopyranosyl azide (SLeo⁺) 155.
